ODI can also be used to create dashboards and reports that can be deployed to a variety of destinations, including a web browser and mobile devices. ODI is available on multiple operating systems, including Windows, Linux, and macOS. The only requirement is that the user has Oracle's client tools installed. # Installing ODI ODI can be installed in the default location on your system, in which case it will be launched automatically when the software is started. You will also be able to locate it on the Start menu or Control Panel (depending on your operating system). On most Windows systems, it will be found in the 'Program Files` directory, but the location will differ from one computer to another. ODI can also be installed on an operating system that is not Oracle's. In this case, the installation is performed by specifying a path to the installation directory. When the software is installed in the operating system's default directory, the software is launched automatically the next time you start the computer. To find out where ODI is installed, you can start the installation program, select the 'Where to install` option, and then click the Install button. A window 520fdb1ae7
