- i just can't get it to work... so i was wondering if someone could help me out janus_ ; Sure, and to confirm again, there is no (root) password, only the account password, the vbox one is waaaaaay better on ubuntu 19.10 hi guys. on a linux system i have in my webroot an.php with the following line `#!/bin/sh exec "php" "$(realpath \\server_path\\xxx.php)"` i want this file to be runnable from other users as well is this the right way to do it? or can you explain me how i can achieve this? pier_ ; I don't know the permissions that your system uses, but having a line `"exec \\phpS"` seems like it will always run as your regular user. If that is the case then I would just write a PHP script that accepts a parameter and does whatever it needs to do. pier_ ; yeah i guess you can just pass it a parameter Pier12345: take a look here yeah i guess i can just put the exe in the same directory as the php script... pier_ ; you can use `-c` on php to force it to execute a php file pier_ ; And as EriC^^ said, it looks like you can do `"exec \\phpS"` if your webserver is not set to only serve php files as.php files, even if they are in the document root. huh? EriC^^ Jordan_U it was not what i wanted how come? EriC^^ i want the webserver to serve this as.php file and not as.php exec "php" "\$(realpath \\server_path\\xxx.php)" is not the right thing 520fdb1ac?
