Marine diesel engines are large units that generate a large amount of heat during their operation. These engines are cooled either indirectly by a closed cooling system or directly by seawater. An indirect method is used to prevent engines from coming into contact with seawater. In addition to salt, seawater also contains limestone and mussels or shells. If appropriate measures are not taken, this limestone is deposited along with other components in the engine cooling system. The cooling of the engines is deteriorating, so they can no longer run at full capacity, otherwise there is a risk of overheating. Therefore, the engines must be chemically cleaned at regular intervals to ensure optimal cooling. In addition, various applications have shown that shell-shaped crustaceans, once they have entered the cooling system, spread and multiply rapidly. The decision with Merus Merus demonstrated on different diesel engines, both on ships and on oil platforms, that these problems can also be solved. When seawater is used directly to cool machines, the problem of calcification and corrosion can be reliably reduced. The negative impact of colonization by shells is similar to high calcification. The Merus ring prevents the further spread of shells and other marine organisms that flow into filters through the system. This has been proven both in coastal applications, where seawater is used for cooling, and in the sea, i.e. on oil rigs and ships. If there is no sediment, there is only a smooth surface for shells. They can't find a foothold here and they won't settle down. The image on the left shows part of the seawater filter. The corrosion, which is usually very strong, is almost stopped. There are no more limestone deposits. The image on the right shows the disassembled light of the filter. A few weeks ago, right after cleaning the filter, you couldn't see through the light. Now, with the Merus installation, the light is almost clean, allowing you to see through. Если вы не очистить его последствия могут иметь катастрофические последствия для вашего двигателя. Самое простое и эффективное решение для устранения is decalcaning. We explain everything in this article! Calculate the price of a decalcaning car: See the price of my car Contrary to popular belief, all diesel engines, old and new, are likely to get dirty! Indeed, to self-clean the diesel engine must regularly rise in temperature. If you use diesel fuel mainly in the city, fuel particles that are not burned can not escape and sediment form: it is called calamine! Against pollution, prevention is better than cure! Apply these tips every day and you will limit the pollution of your diesel engine to the maximum. Here we explain everything you need to know to print out the engine while driving! Necessary material: Fuel Engine Fuel 1: Fueling quality fuel ⚡ fuel anchor The first thing to do to keep your engine too dirty to choose a fuel known as good quality. Indeed, thanks to their Premium diesel additives, they limit the formation of dirt and therefore extend the life of your engine. Step 2: Add additives ⚡ addytive anchor Another solution to avoid engine pollution is to add additives to the fuel. Supplements are sold at gas stations or auto centers, these cleaners can get rid of some dirt. To add fuel additive, it is easy to unscrew the bottle and insert the additive directly into the fuel tank. Step 3: Avoid short trips (less than 5 km) ⚡ anchor journey When you drive very short distances, your diesel engine has no time to heat and thus to clean itself: it gets dirty a little or less! To shrug off the diesel engine, it is advisable to drive regularly on motorways where you can drive at high speed and thus use the engine to print it out. Step 4: Regularly drain the motor oil ⚡ drain the anchor, when the motor oil is too old, it contributes to the accumulation of dirt. Make at least one runoff each year, plus if you drive a lot. To learn how to drain motor oil, you can check out our article on plum. Calculate the price for your car sticker: See the price of my car before you take your car to the garage, make sure it's a pollution problem! Some signs are not misleading: No choice, you have to go to the garage to thoroughly clean the engine and exhaust system! Teh The fastest and most economical sticker is. This eliminates calamin deposits in the engine and in the EGR valve, FAP and turbo.⚡ How to debalat the diesel engine? Decalcalaming is a new technique used to scrap diesel engines. In fact, it is a complete cleaning of the engine block. This method does not require any use of chemicals, in fact it consists of sending a mixture of hydrogen and oxygen through the air intake system. Prices vary depending on the processing time required and the type of decalkinate (with hydrogen or chemicals). According to our calculations, the sticker costs an average of 87 euros. Warning: not all garages are equipped for stickers! Our garage comparator lets you find a garage owner who offers stickers near you. Last tip: to avoid returning dirt after stickers, consider whether your injectors are cleaned by one of our trust garagists! When your injectors are contaminated, the injection gets a mess and some of the fuel does not burn and contaminates the rest of the chain.
