Inteligencia artificial medicina ppt

Edgar Hernandez, CATREDRATICO at UNAN FAREM CARASO No notes on the slide. Problems with viewing this page? Go to our diagnostic page to see what happened. Artificial intelligence automates re-learning and discovery using data. Artificial intelligence is different from hardware automation of robots. Instead of automating manual tasks, artificial intelligence performs frequent, large, voluminous computing tasks reliably and without fatigue. For this type of automation, human research is still crucial to building a system and asking the right questions. AI adds intelligence to existing products. In most cases, artificial intelligence will not be sold as an individual application. Instead, the products you're already using will be enhanced with artificial intelligence resources, just as Siri has been added as a feature for the next generation of Apple products. Automation, conversation platforms, bots and smart machines can be combined with large amounts of data to improve many technologies at home and in the workplace, from security intelligence to investment analysis. Artificial intelligence adapts with advanced learning algorithms that allow data to perform programming. Artificial intelligence finds structure and patterns in the data so that the algorithm acquires skills: the algorithm becomes a classifier or predictor. So, just as the algorithm can learn to play chess, you can also find out which product to recommend below on the web. And models adapt when they are given new data. Backpropagation is an artificial intelligence method that allows models to make adjustments, through training and aggregated data, when the first answer is not quite correct.
