Eyes watching emoji

Source: Apple.com Apple Watch is not the first smartwatch, but its launch has started an interesting conversation about how editing will affect our communication habits. Due to the small shape factors of the wearable wrist and other wearable devices, the messaging app will look to allow users to communicate easily but really as possible. But will messaging on Apple Watch and similar clothing reduce our conversations to the acronym of stickers and emojis? Sam Byford reports for The Verge that messaging apps can be the best thing about Apple Watch. He explained that Asian messaging apps such as Line, WeChat, and Kakao Talk have set rates for Silicon Valley. In addition, all of these apps were in the Apple Watch during the launch, where they turned out to be very suitable for user messaging needs. And it all comes down to the popularity of stickers. Most users in the United States may have found the sticker, which Byford describes as a big emoji with more personality, via Facebook Messenger. They are a more prominent and important feature for Asian users, and offer fast and contextual ways to enrich text conversations. Line, Kakao Talk, and WeChat all introduce similar Watch apps that allow users to reply to messages with stickers directly from apple Watch, and for users familiar with chatting with stickers, they can often be everything you need to reply to messages. Stickers are the main reason that Asian chat apps are so interesting, Bryant reports, and that's why they work well on the wrists - it's easier to convey joy with crazy bunny grins than clumsy sketches using Apple's digital touch. He added, it almost feels like a sticker has made for the Watch. While some developers have created strange and forward messaging apps for Apple Watch, their ability to build interesting software has been limited because SDK WatchKit doesn't run on the watch itself, and instead relies on companion applications installed on paired iPhones, where all data processing takes place. But the original app comes with watchOS 2.0 and WatchKit 2.0, which will bring faster and more powerful apps to apple Watch, and may indicate some potential untested devices as messaging devices. With Apple Watch's limited screen size, communicating via emoji, stickers, and perhaps other short forms of messages is natural fit. As Emma Bowman reported for NPR earlier this year, the use of emojis across cultures

and age groups suggests that we are entering an era of hybrid communication. Application the most popular in Asia actually encourages users to choose stickers instead of written words. But the widespread use of all pictures, without text to provide context and without unified translation to explain what all meanings, can actually complicate communication. That doesn't seem promising the depth of the conversation we'll have if the messaging app for Apple Watch and similar clothing reduces our discussion to stickers and emojis. Nick Stockton recently reported for *Wired* that the emoji might change written English. And while language changes all the time, the question is whether emojis will ride their cultural appeal long enough to be discretionary, complete means of communication or if they are destined to remain lexical fade. Emojis are not languages, and actually have a lot of constraints on pidgin linguistic structures, a new language created from extreme need when people with two different languages come together. You cannot use emojis to discuss past or future or third-party events without providing the subject with a written word. The only way to compound is to add more emojis, and connecting words like occasions and pronouns is completely absent. Pidgin got those aspects only when it was passed on to another generation and became a creole. Creoles have tense, nuanced, and grammar. Emojis are closer to the slang than anything else. And like creoles or slang, emojis are used most fluently by youth. Emojis may seem like a new language to people who don't use it originally, but teenagers faded linguistic percolate out in some way, as Stockton explained. One, the person who uses the lingo grew up. Two, older people are catching up. Young people are vectors of the disease in linguistic memes. Which emojis may die. How messaging apps for smartwatches and other clothing will develop is equally impossible to predict the future of emojis. But in both cases it seems reasonable to hope that the mode of communication we experiment with will not have a negative impact on our ability to have meaningful conversations with each other, whether we need to take advantage of quick messages from our wrists or take the time to pick up the phone. More from [Gear Sheets](#); [Style Cheat](#): The lack of correct taco emojis remains misleading. You can text someone flan, or two different meats on a stick, but this staple of both a Mexican and American diet continues to get short in Emojiville. When someone texts you want to dinner, if the answer is tacos-and let's be real, usually-you're forced to type words with text, rather than being able to describe your wishes with simple images. JustWink app from American Speech aims to provide a to the correct lack of taco emojis, even if you're an early Practitioner of the Apple Watch. The app allows users to send each other animated images (usually winking). American speeches and agency partner Mullen created some suitable big fanfare around a small taco, setting up Trucks in Apple stores around New York offer real free tacos, and opportunities on Apple's \$400 gift card, to early Apple Watch buyers (watch-less can download the free JustWink mobile app, which comes with a taco greeting card). Of course, JustWink isn't the first company to bring bootleg taco emojis to Apple devices-even if they should be the first to make it to the watch. Austin, Texas-based XOXCO (where they know from tacos) created the Taco Text app in late 2014, a simple messaging app that is basically Yo for tacos. All this will be done, at any rate, until Apple finally delivers a taco emoji so many people dreams. Emojis have taken the text world by storm over the last few years, but if you've now seen the light, here's how to use emojis on your iPhone to send your friends' smiley faces and virtual kisses. Enable Emoji Keyboard The first thing you need to do before you go crazy is to enable the emoji keyboard on your iPhone, which isn't enabled by default. So, if you look around your keyboard wondering where the emojis are, don't worry-you're not crazy. To enable the emoji keyboard, start by opening the Settings app from the home screen. Tap on the General. Scroll down and select Keyboard. Tap on Keyboard at the top. Select Add new keyboard.... Scroll down and select the Emoji keyboard. After you select it, it will appear in your keyboard list. From there, you can close the settings app and return to any app that uses the keyboard. You'll now see that the emoji button appears on the keyboard. Tapping on that button will bring all the emojis, and you can swipe to scroll through it all to select one. To return to the regular keyboard, simply tap on ABC in the bottom left corner. How to access Different Skin Tones On several emojis, you can choose different skin tones go from lighter color to darker colors. To do this, all you need to do is tap and hold the choice of emoji and tone of the skin will appear for that emoji. After choosing a skin tone, your iPhone will remember that option and turn on the emoji from yellow to the tone of whatever leather you choose. That way, you don't have to re-select it every time. This only works on hand emojis, as well as some people's emojis. It doesn't work on regular smiley facial emojis, and some emojis are dropped out of this feature too. Easily Replace Words with Related Emoji Another new feature in iOS 10 is the ability to type messages and replace keywords with associated emoji those words. It's certainly not something useful or productive by any means, but it's a fun way to communicate with friends. To do this, start by typing a message or replying that you plan on sending it to your friends. After you type your message, do not send again, but tap on the emoji button in the lower-left corner of the keyboard. When you do, you'll notice that some of the words in your message will be highlighted. Tap on these highlighted words to replace it immediately with associated emojis. Sometimes, the main word will relate to more than one emoji. When that happens, taping a word to change it to an emoji will bring a pop-up giving you some emoji options to choose from. From there, select one and it will convert the word to the emoji you selected. Make the Most [Sticker Keyboard](#) advantage Third Parties for More RELATED Emojis: How to Install, Manage and Use iMessage iOS 10 Apps adds more fun such as emojis to iMessage in the form of stickers, which you can get from the iMessage App Store. You can also download third-party keyboards filled with new emojis that don't come stock with iOS (such as Emoji+, for instance), available in the regular App Store. Your recipient doesn't have to download additional packs either; they'll see whatever you send. (Sending to Android users can cause them to display somewhat strange, however.) We have a guide that takes you through the process of installing iMessage apps and stickers, but here's the gist: open a new iMessage, tap on the App Store icon, select an icon that looks like four small ovals collected together, and then tap on the plus icon, which will open the iMessage App Icon. From there, you can browse and find sticker packs and download them to your iPhone. Although adhesives are technically not emojis, they can sort act as emojis with other iMessage users, and many sticker packs resemble emojis in a way. However, you can't include stickers in text. So, if you type a message and want to include a sticker, you won't be able to include two of them in the same message. Instead, you'll need to send the sticker yourself like you're going with a photo, or texting you and then immediately address the sticker to your message. One of my favorite sticker packs so far has been Retro Emoji, offering a handful of old school emoticons using regular keyboard characters, some of which you might recognize. Obviously, there is a ton of sticker packs to choose from, and as time progresses, there will likely be more sticker packs to come, mainly because iOS 10 is still relatively new. You may already be an emoji master, especially if you're using another third-party messaging app, but while iPhone has been having emojis for a while now, Apple has been relatively new to the party when it comes to it to Emoji capabilities, but they quickly catch up and the new features in iOS 10 are proof of that. Which. Which.
