Read more 4 of the 168 top solutions for Verizon Network Extender Base Stations (Verizon) in a world with LTE Advanced and 5G, you'd think you'd see a solution that would more than make your smartphone's signal bar shine furiously and curse poor coverage. Sadly, just because a carrier is looking for the next generation of networks right now doesn't necessarily mean you'll get a decent signal at home or in the office. Now Verizon is deploying a new 4G LTE network extender 2 with the aim of filling that dead spot. This is Samsung's follow-up to the original 4G LTE network extender, launched in 2016. As such, it effectively creates a small, personal cell phone base station where you plug it in. Verizon says it should provide coverage of up to 7,500 square feet, or the equivalent of coverage with a radius of about 50 feet around the extender. Like mobile phone signal boosters, Verizon's system works by connecting to a broadband network via a cellular connection. 4G LTE network extender 2 must connect to an Internet connection using at least 10 Mbps downlinks and 5 Mbps uplinks. However, carriers are recommended to at least double these figures for the very best service. Up to 14 active users can be connected to the extender at the same time to take advantage of voice and data services. The device supports 4G LTE data, HD audio, and video calling. However, there is no 3G EVDO or 1X voice support. Relatively recent smartphones shouldn't affect anyone, but older devices can be left behind. There is also no support for plugging in landlines. Setup is easy, Verizon said, and doesn't require a computer. An LCD display is built into the front of the extender throughout the installation process. Use the optional kit to mount it on the wall. It should also be connected to a GPS receiver used for time/date and location information so that the 911 emergency service call can be completed properly. When you start a call using a signal from the extender, Verizon says you need to be able to migrate directly to a regular network without having to drop the call. The 4G LTE network extender costs \$249.99, but unlike femtocells previously seen, there is no ongoing subscription fee for its use. Instead, you buy it overtly, plug it in and just keep it working. In particular, there is no way to control which devices can connect to the box: if Verizon has neighbors, the phone will be the #48サービスを使用するのを止めるものは何もありません.
