Bird Bar gives you access to your fall notification, even if the bar menu is not visible. We've all been there: You settle down for some intense Angry Birds action and you get a text message, but you don't have a bar drag notification down. Just run Bird Bar side by side with full screen apps or games and you'll have access to it no matter where you are. You can drag it down from the top as usual, or even set up a Bird Bar to allow you to drag it from the side as well. Bird Bar is a \$0.99 download for Android. There's also a free version available that works well but provides fewer configuration options. Bird Bar Android Market via AddictiveTips You can contact Whitson Gordon, author of this post, on whitson@lifehacker.com. You can also find it on Twitter, Facebook, and lurking around our #tjps page. Here's what we're seeing: Many of you have also given a shout out to the quixilver in your bar menu, while many others have noted that they work but don't allow access to the bar menu as it really isn't necessary. Yes, and the same goes for Snarl. When it comes to chat, most of you are rocking Adium. Mac OS X only: Growl is a free notification system for your Mac. Read more Thanks for everyone who submitted. If you see an app that you don't recognize, or an app that you particularly like, let it scream in the comments. If you haven't submitted, we'd still love to hear your favorite bar menu apps in the comments, too. Last year, Android's own vice president of design, David Burke, tweeted that the Android sharing menu in its current form should be much faster and easier to use. Well, it looks like he's serious about making changes, since the first beta version of Android has a slightly updated exchange menu that is, in fact, faster and easier to use. Now that you share something like a link to a web page or photos you've taken, the stock menu looks a little different. If you share a web page, for example, the top of the new menu share will be the URL. You share along with a copy icon that will copy the link to the clipboard. Below this link will be the usual sharing icons for various apps on your device. However, these common icons will appear much faster than usual. It looks like Google has changed the API to connect apps to its native Android exchange module. With that in mind, it may be that some apps will share faster than others as they adopt this new API. While this is not a radical revision of the menu sharing, it's certainly nice to see that Google is working to make this long clumsy feature better overall. Also, this is only the first public beta of Android - we still have five more releases to go. During this time, who knows how much better the menu exchange can be done. NEXT: There are six Android and beta versions on Google's Timeline. Source: Harish Jonnalagadda / Android Central Rolled out the first public beta version of Android 11 for Pixel, and one of the most interesting changes around the power button menu. Android 11 has a redesigned power button menu with Power Off, Restart and Emergency buttons at the top of the screen. But the big change involves tiles that take up most of the screen. These tiles make it easy to control smart home devices in your home, and they give you a quick visual indicator about the status of various IoT devices. If you left the light in the garage, for example, you will be able to see it from here and quickly turn them off. A short push on the tile will switch the device on or off, and the long press will pull up additional options. For example, a long-term tap of smart light will allow you to change the brightness or color directly from the menu without immersing yourself in the Google Home app. I haven't tried this yet, but screenshots from earlier this month showed a live security camera viewing directly on the menu - a great addition. Source: Android Central You can add or edit tiles by selecting an activity overflow menu, and by default feature tile surfaces from devices that are already connected to the Google Home app or linked to your Google account. In addition to the smart home controls, you'll see a section on Google Pay and loyalty cards that will make it easier to pull up the card when you pay for items in the retail store. Ultimately, adding smart home controls and Google Pay maps makes the power button menu much more useful, and you don't have to dig into the Google Home app to quickly turn off the lights or other IoT gear. Cheap and good there are quite a few Android phone deals on Prime Day. If you're in the market for having dirt cheap, you can't do better than the \$200 Moto G Power. Top Android tablet of all prime day deals that fly under the radar, please don't skim past this one! With a beautiful screen, fantastic build, and included S Pen, the Samsung Galaxy Tab S6 will make you wish you'd tried a Samsung tablet before. Teeny tiny Apple introduced the iPhone 12 Mini, and to be honest, it looks amazing. Whether you like iOS or not, that's why it's the best thing to happen to Android in a long time. Protect your FE Samsung unveiled Galaxy S20 FE and the device is sure to turn a lot of heads over a few months. With stiff competition in the mid-range range it is clear that Samsung wants to compete and the S20 FE is fantastic. If you choose one of these amazing new devices, make sure you pair it with an event to keep it looking awesome. In this day and age of weak battery life, it is incredibly important to keep an eye on your use. Unfortunately, Android doesn't show you exactly how much battery you have left is just a vague graphic. Here's how to add a more accurate percentage to this icon. You can always see the percentage of battery by dragging down the bar notifications twice, but that doesn't exactly give you at a glance of monitoring. You can always turn on the battery percentage in Android 6.0 Marshmallow with a few hidden settings, and in 4.4 KitKat and 5.0 Lollipop with a very hidden setting. How to show the percentage of your battery in Android Marshmallow To incorporate this feature into Marshmallow, you need to incorporate Marshmallow into the UI tuner interface system, which gives you access to some hidden settings. Pull down the notification shade and then pull down a second time to show the quick settings of the panel. (You can also pull the shadow notification down with two fingers to reveal this panel.) Find gear settings along the top. Press this gear icon for a few seconds until it starts spinning. Release your finger and you should see a pop-up that tells you that Tuner's system user interface has been enabled. Click on the System UI Tuner option in the Settings window that appears and accept the warning that pops up. On the System UI Tuner page, turn on the Show built-in battery percentage. The battery icon will now display your charge level at any time. How to show the percentage of your battery in Android KitKat and Lollipop KitKat and Lollipop actually have this feature built in, but the installation is even more hidden. In fact, the installation does not exist at all! The only way to disable it is with multiple ADB commands, or the Battery Percent Enabler app from the Google Play Store. You don't need to be rooted or anything to use this, so most KitKat and Lollipop phones have to find this job with the instructions below. Open the Google Play Store on your phone (or go to the Google Play Store in your computer browser) and look for the Percent Enabler battery. Choose from kroegerama (there are several apps with the same name). You can also click on this link to go straight to the Battery Percent Enabler page on your computer or phone. Click the Set button to install it on the device. (If you're doing this from a desktop browser, make sure you've picked the right device from the dropout list). Once installed, click the Open button that appears (or go to the app in the app drawer). Check the box: To turn on the battery percentage and Phone. After rebooting your phone, you have to find that the Android battery icon shows how much how much He has. There is one drawback though: on some phones, the percentage of text is white, the same color as the battery icon. So you can only see a percentage of the battery if your battery is more than halfway drained, so the white text is on an empty gray background. Clearly, it was an unfinished feature for KitKat and Lollipop (probably why it was hidden), but it's still better than nothing. There are many other apps that add a percentage of the battery to your bar menu, but they show how their own individual notifications are rather than part of the built-in Android battery. We believe that the above solution is the best for pre-Marshmallow phones. Keeping track of battery life is just one step: the real trick is knowing how to extend your phone's battery life as far as possible. For more information, check out our beginner and advanced guide to extending the life of the Android battery. If you follow my articles about lacing and streaming devices, you'll know that historically, I'm a massive Roku fan. You will also know that the Nvidia Shield recently stole my heart. No other box on the market is approaching in terms of functionality, speed and choice of applications. For those who don't know, the shield runs Android TV. This is far from the only set-top box to rely on the operating system. Amazon Fire TV, WeTek Core, Mi Box, q-Box, and countless others also use it. Oh, and these days, you'll also find lots of smart TVs with built-in Android TV. As you would expect, some aspects of the Android TV operating system bear similarities to the android mobile version. However, there are also some fundamental differences. Many of these differences are in the Settings menu. In this article I'm going to discuss the Android TV Settings app and explain some important features that you should know. Note: Some settings may differ slightly depending on the box you have. This guide was written with the help of Nvidia Shield. 1. Display and sound display and sound menu may be part of an app that is significantly different from the mobile version of Android. There's no sign of melody, screensaver, or screening. The basic menu has four options: Resolution: You can choose from 1080p 59.940Hz, 1080p 60Hz, 1080p 50Hz, or 1080p 23.976Hz. Power management: Your Android TV box works with the CEC. The CEC advocates control over consumer electronics. This allows your box to control the TV's entry. If you turn on the Android TV box, the TV itself will automatically switch to the correct input channel. You can also set up the IR blaster remote in this section if it's supported. Volume control: Lets you decide if you want to control the volume Android TV remote control. Sounds: As a mobile version of Android, it regulates audio clicks and alerts as you navigate the operating system. You can also set up some extended settings. For most of the majority There are only three you can change: Adjust for Overscan: Used if your TV cuts off some of the image Fixed Volume: Disables The Internal Volume Control Android TV USB Audio Mode: If your TV supports Dolby 5.1 surround sound, this is where you turn it on at 2. The system again, the menu system doesn't look anything like its mobile-based cousin. You have only two options. The first of the two, LED brightness, will not be useful for most people. Normally, you'll use the TV image settings to get on-screen visuals looking the way you want. The second, processor mode, is more exciting. If you have a box with little RAM or a weak processor (like a Fire TV Stick rather than a full-fledged body box), you should make adjustments. You have two settings to choose from: Max Performance and Optimized. In almost every case, choose Max Performance. 3. Keeping and resetting the storage and reset menu is more like what you're used to. Under the storage device, you will see the space left on your Android TV device. If you click on the name of the device, you will see a detailed breakdown. If your device has a usb port and you've attached an external drive, you'll also see it in this menu. Some devices also allow you to mount storage as a network drive, allowing you to send files from your computer directly to the media player. Click on the network store to turn on the feature. Finally, you'll find factory Reset in this menu. Using this option will destroy all the data stored on your Android TV, so make sure you've made the appropriate backups before proceeding. 4. Screensaver Remember, I told you that you won't find saver options in the menu display and sound? That's because it has a whole section of menu dedicated to it! You have three default saver options to choose from: Off: Your TV will display a blank screen. Backdrop: You'll see a slideshow of stunning photos from around the world. Colors: Provides a psychedelic swirling display. Some third-party apps add more options to this list. For example, MUBI offers slideshow footage from the show that you can watch through the app. Next up the list, you'll be able to set up screensavers and sleep timers. Right at the bottom of the menu, pay attention to Stay Awake for music. If you're using your Android TV to listen to apps like Spotify or TuneIn Radio, you should include this setup. 5. Home screen Once you get down to part of menu preferences, things start to look more familiar. Date and time, language, keyboard, search, speech and availability are almost identical to the mobile version. However, located in the middle of the menu, you'll see the Home Screen option. This setting controls how apps appear on the Android TV home screen. Click on the link, and there will be two more options: a line of recommendations and and The Games of The Line. Recommendation Lines: Android TV automatically displays content it thinks you would be interested in at the top of the home screen. It gets videos from apps installed on your device. In this setting, you can disable some apps from appearing. For example, you may not want to see recommendations from Netflix if you're not a subscriber. Lines of apps and games: In the lines of apps and games, you'll find three more settings. The first option allows you to automatically sort installed applications by recent use. The second and third options allow you to manually reorder apps and games accordingly. 6. Add accessory depending on the device you have, you could add third-party Bluetooth accessories. They can take the form of game controllers, TV remotes, or even mouse/keyboard combos. To add another accessory to the device, go to the remote control and accessories to add accessory. The device will immediately begin scanning nearby Bluetooth devices. Once the device is found, follow the instructions on the screen to get it up and running. 7. Accounts The final part of the Settings app is dedicated to user accounts. Unlike the mobile version, they are listed in the main settings menu rather than tucked into their own section. Any logins you type in the device will be listed. This includes credentials for services such as Google and Microsoft, but also apps such as Netflix and Spotify. Click on one of the accounts, and you can choose which data is synchronized over the network, how it often syncs, edits login data, or even completely removes the app from your system. In this article I explained some key differences between the Android TV Settings app and the Android Settings mobile app. While the interface will be largely familiar to anyone who has spent time in the Android ecosystem, the differences can mislead non-tech-savvy users. Next, how about adding a few apps to the setup. We'll show you how to install Google Chrome on Android TV. This \$16 Banana Pi Offers Double Core AI Accelerator Once thought like Raspberry Pi clones, Banana Pi one board computers continue to push low-budget AI computing limits.
