# 2.1.2.2 Description SP Software: The SP Software supports a bootloader for programming the controller, as well as a main module for managing the vehicle's components and checking its health status. SP Software features: Auto-On/Off: When the engine is turned on (via the key), the SP checks if the vehicle's battery is sufficiently charged to start the vehicle. If not, the SP enters the Auto-On mode. Then the SP will check each time the engine is turned on whether the battery is sufficiently charged. If the battery is not sufficiently charged after the SP enters the Auto-On mode, the SP will shut down the vehicle and will turn off its engine as well. If the battery is sufficiently charged to start the vehicle after the SP enters the Auto-On mode, the SP will turn on the vehicle's engine, and will check if the battery is sufficiently charged after the engine is turned on. If the battery is sufficiently charged after the engine is turned on, the SP will start the vehicle. If the battery is not sufficiently charged after the SP checks whether the engine is turned on, the SP will shut down the vehicle and will turn off its engine as well.

Acceleration/Deceleration: The SP can be programmed to increase and decrease the vehicle's speed (decelerate or accelerate) as a function of the battery's charge level. Acceleration/Deceleration is an example of how the SP Software makes it easier to perform typical tasks on a vehicle. Acceleration/Deceleration includes several steps: 1. As the vehicle approaches a defined charge level (e.g. 9.5 V), the SP will increase the vehicle's speed. 2. As the battery charge level reaches the defined threshold, the SP will accelerate the vehicle. 3. As the battery charge 520fdb1ae7
