If you don't know how to install apps on your iPhone and iPad from the App store, you may follow this link. 1. Field of the Invention The present invention relates to an image forming apparatus which forms an image by transferring and fixing an unfixed toner image formed on an image bearing member onto a recording material. 2. Description of the Related Art In the field of electrophotography, it has been well known that an image is formed through the steps of forming an electrostatic latent image on a photoreceptor drum serving as an image bearing member, developing the electrostatic latent image by means of a developing device to form a toner image, transferring the toner image to a recording material (for example, paper), and fixing the toner image transferred onto the recording material. As is well known, a toner generally used in an image forming apparatus includes a toner core, a charge control agent for controlling the polarity and amount of charge of the toner, and a resin component which is one of essential components of the toner. The toner core (toner particle) is produced by mixing and melt-kneading a binder resin, a coloring agent, a charge control agent, a parting agent, and the like. This toner core is formed into a spherical toner through a pulverization method and a grinding method. In recent years, for the purpose of saving energy, recyclability, and the like, demand for energy saving and environment-friendly is becoming more and more increased in the market of image forming apparatus. In this regard, the toner of the image forming apparatus is required to reduce a toner consumption amount per one image, improve an image fixability, and the like. In particular, the toner used in an electrophotographic image forming apparatus requires a high-temperature offset resistance, a high-temperature fixability, a high-temperature melt-fixability, a low-temperature offset resistance, a low-temperature fixability, a low-temperature melt-fixability, a high-temperature storage stability, and the like. As a toner to satisfy such requirements, there is known a toner obtained by including a core-shell type toner particle including a core resin and a shell resin, which is obtained by a emulsion polymerization method and a suspension polymerization method (see, for example, Japanese Patent Application Laid-open No. 2006- 520fdb1ae7
