Top 200 drugs brand generic list 2020

Drugs 1-20 Cheat sheet drugs 1-20 Leaf PTCB Test Prep Therapy Training top 200 brand and generic drugs can be challenging. Many medications have more than one active ingredient - and there are often many different brand medicines for each drug. This makes the learning process exhausting. However, the format of the PTCB exam is in your favor. Many medications have similarities to either the name of the drug or the disease or the condition it is licensed to treat. Once you start identifying these similarities, it becomes much easier to match them on exam day. For example: Medicine: Clozaril; Active ingredient: clozapine; antipsychotic drug. Medicine: Glucophag; Active ingredient: metformin; antidiabetic drug. The name Glucophag comes from glucose and phage, which comes from Greek to cannibal. Medicine: Diflucan; Active ingredient: fluconazole; antifungal drug. Medicine: Haldol; Active ingredient: haloperidol; antipsychotic drug. Medicine: Ventolin; Active ingredient: albuterol; beta-2 agonist used to treat asthma. Think of hyperventilation, or rapid breathing. However, there are many medications that do not have such obvious links. Students should remember drugs with a clear link between medicine and name. Once they are dedicated to memory, you can easily identify them from a list of 4 MC options on exam day. Now you can spend more time on more complex ones. That's where the flash cards come in in at PTCB Test Prep, we've prepared hundreds of flash cards to help you commit these medications to memory - detailing the best medications, readings, side effects, and action mechanisms. Flash cards, if you do the right way, are the best way to learn the top 200 brand and generic medicines. These include practice, practice, practice - and re-exposure to the names of medicines and medicines. Eventually, the drugs will stick. If you can't find a link between the name of the drug and the drug, invent a memorable one - even if it happens to seem strange. In fact, the more bizarre the link, the more memorable it becomes. For example: vardenafil is the active ingredient in Levitra. No tangible connections. However, we can create one. Take the console, LEVIT-, and turn it into a levitation, something that rises. Vardenafil is used to treat erectile dysfunction, so the concept of levitation/growth suits is pretty good in this case. Now, every time we think of Levitra, we will remember to levitate/grow and its now obvious connection to erectile dysfunction! So let's draw our attention to the top 200 brand and generic drugs - each detailing with all the active ingredients and what drug every ingredient belongs. Top 200 brand and generic drugs! Note: when you finish the study table below, take our Top 200 Drugs quiz!
