I bought the VCI3 for a Scania Cv-8 with an updated ECU and it did all it was supposed to. Yes it did take longer than just switching over the ECU but it did everything I needed. To be honest I was a little scared at first as it said there was some user interaction involved, for the most part it's not, just loading the program, pressing start and stopping when you're done. Your ECU is located behind a plastic panel on the passenger side of the dash, the instructions are pretty clear about that and where to find the buttons. I'll try and attach a photo of the back of the dash and the ECU from a similar vehicle for reference. I'm not sure what you mean by using something "in between" the stock ECU and the standard OBDII port. I can't find anything that says that. I only ever have one cable going to the OBDII port, the other is for the J2534. The VCI3 has another cable for the Factory OBDII port as well as a separate cable for testing the sensors, so there is some user interaction involved. The main function of the VCI3 is to allow you to test the various OBDII parameters as a diagnostic tool for the factory ECU. For example you could check the stock OBDII for certain parameters to see what is causing the problems and from there you could start working out what the most probable cause is. In my experience it has been a very good investment for the price I paid for it. I also bought the Ktag SBB Key Programmer for my daughter's car. The VCI3 was slightly cheaper than the Ktag so I got both. I 520fdb1ae7
