exe package that includes only the front, Q: Can you make a Dropdownlist value NOT repeatable using.NET 2.0? I have a dropdownlist with values 1-5. There is also a textbox, which can be used to create a new value. This is done by pressing a button. When a user selects a value, I'm storing it in a database, however I don't want the same value to be selected again. I'm guessing this will be impossible to do in.NET 2.0? Is there any work around this? A: As I already wrote in the comments, there is no way to enforce uniqueness in ASP.NET. But there are ways to prevent users from entering the same value, such as using a maskedTextBox or a similar technique. Paulo Assis Paulo Assis may refer to: Paulo Assis de Almeida (born 1949), Brazilian politician Paulo de Assis (1808–1840), Brazilian poet Paulo Assis (athlete) (born 1976), Brazilian Paralympian athlete Paulo

A lot of data exist in the target system. So I have to migrate all data from the source system to the target system. I am using Python 2.7.3 and it's easy to use read_csv to do so. However, it seems that read_csv will generate the filename the same for every csv file in the directory. Is there any way I can generate a unique filename for every csv file in a directory? Thanks! If the target system (in your case a directory) exists you can use this code import random import os import csv random_dir = "F:/" for dirpath, dirnames, filenames in os.walk(random_dir): print(dirpath) for filename in filenames: random_filename = "{ 520fdb1ae7
