Use the list of supported data sources in the help documentation. Learn more about learning to use Cloudera Discovery or No attached data sources by reading their documentation. Work with large unstructured text data sources like PDFs or MS Office Documents. You can access data like it was in the cloud with standard tools like the Python Notebook Notebook Viewer or with the web-based No editor. Extend your skills by learning to use new tools or learning to use them better. Explore your data with tools like Kite, Spark Data or Airflow. Use your No experience to explore machine learning, databases, and data science: TensorFlow, Apache Spark, and Mesos to name a few. Discover what is possible with No, with examples of Kaggle Notebooks, Python Notebook, and tutorials. Q: How to write to the output stream of an org.apache.commons.io.output I want to create a simple task that copy the contents of a file (contents are in a list of strings) to the output stream of the writer. So I have a java program that want to write the contents of a file on disk to the output stream of the writer. The code of the writer is the following: public class AppendWriter implements Closeable { private static final Logger LOG = Logger.getLogger(AppendWriter.class); private BufferedWriter out; private boolean closed; public AppendWriter(BufferedWriter out) { this.out = out; } public void write(String string) { if (!closed) { out.write(string); out.write("\n"); } public void close() { if (closed) { return; } try { out.flush(); } catch (IOException e) { LOG.error("Cannot flush appender", e); } closed = true; } This is a console app that invoke the writer: public class Main { public static void main(String[] args) {
