Case. 31, 33-33. doi: 10.7748/ns.24.31.33.s43 Want to know more? Page 10 Angela Mary Tod Chief Scientist, Centre for Health and Social Welfare Research, Faculty of Health and Wellbeing, Sheffield Hallam University, Sheffield Rose Joan of Sickness Clinical Nurse Specialist/Research Assistant, Rotherham Hospital, Rotherham Purpose to examine the factors that delay reporting lung cancer symptoms and develop an early reporting tool that would encourage people to report symptoms early and to request. A Method Expert Group of 16 health care workers who survived lung cancer and lay six focus groups were conducted with 39 health professionals and members of the public to study the factors influencing delay in reporting symptoms and develop a tool. The study's findings showed poor knowledge of the symptoms of lung cancer. Issues that affected the delay in reporting symptoms included the tendency to attribute other symptoms, self-management cough and fear of treatment to health care providers, such as blame and stigma associated with smoking. Concluding An Early Presentation and Evaluation for the Treatment of Lung Cancer can improve survival. However, there appears to be a delay between patients noticing symptoms and reporting them to a doctor. Nurses play a key role in helping people overcome barriers to reporting possible lung cancer symptoms. Information activities such as those developed in the study could support nurses in this work. Nursing standard. 24, 31, 35-43. doi: 10.7748/ns2010.04.24.31.35.c7690 Correspondence a.tod@shu.ac.uk Review This article has been the subject of a double-blind review of keywords: Diagnosis - health promotion and education - lung cancer Want to know more? This is beneficial to patients and staff at Coventry University Hospitals and Warwickshire NHS Trust. Nursing standard. 24, 31, 45-48. doi: 10.7748/ns2010.04.24.31.45.c7691 Correspondence judith.smith@uhcw.nhs.uk Review This article was the subject of a double-blind review Want to know more? Page 12 Dean Gould Professor of Applied Health, City University of London Escherichia coli is a normal resident of the human gastrointestinal tract and can cause health-related infections. The body is most often responsible for urinary tract infections and is a bacterium most often implicated in the cause of diarrhea in humans. In recent years, the E.coli O157 strain has gained notoriety for causing foodborne infections, which can have serious health consequences, especially in young children. This article describes the range of different infections caused by E.coli in health facilities and the community and discusses the characteristics of different strains of bacteria that explain the differences in their pathogenicity. Nursing standard. 24, 31, 50-56. doi: 10.7748/ns2010.04.24.31.50.c7692 Correspondence d.gould@city.ac.uk Review This article was the subject of a double-blind review Want to know more? Page 13 of Mary Swoish Bank Nurse, Enniskillen, County Fermanagh Mary Swoish has more knowledge about nurse reporting for intravenous therapy after reading an article of the training area Article explored how intravenous therapy is no longer limited to the introduction of medically designated agents, how it should be taught in a bachelor's curriculum and how laws can affect nursing procedures and accountability.
