

Exercise 1

In Flint Michigan, the crisis about lead in the city's drinking water has had serious effects on children's development. Watch this [video](#).

Below is a list of the ways in which children's physical, cognitive, and social-emotional development is impacted by lead poisoning. Match the negative outcomes with one of the three categories of development.

- a. Physical Development
- b. Cognitive Development
- c. Social-emotional Development

1. Learning disability	<input type="text"/>
2. Self-concept	<input type="text"/>
3. Difficulties with hand-eye coordination	<input type="text"/>
4. Speech delays and impairments	<input type="text"/>
5. Sense of safety and security	<input type="text"/>

The above image is taken from my online publication “Lifespan Development: Telling the Human Story” (2018), published through Great River Learning.

Students in FCS 301 Lifespan Development who are taking the class both online or face-to-face, must complete a series of exercises throughout the 11 chapters of the publication. This is one example of the exercises that students must complete in order to receive points for class participation. In the example above, students are asked to put their understanding of development to identify that ways that children’s physical development, cognitive development or social development are affected by lead poisoning. I developed all of the exercises throughout the textbook, which contain 4 - 6 exercises per chapter.
