Here are the sounds that are labeled with Scary free of SoundBible.com Please bookmark us Ctrl +D and come back soon for updates! All files are available in both Wav and MP3 formats. The science behind the creepiest soundtracks mage via Max Pixel scary film would be much less scary without the soundtrack. Close your ears during the most tense scenes, and they almost get boring. Take this recut from the trailer for The Shining as a happy family movie (Shining). It's funny partly because of the voice-over, but mainly because of the upbeat Peter Gabriel music at the end. It also works the other way around, as evidenced by a fan-made trailer for Frozen as a horror film. Music makes scary movies scary - but what makes scary music scary? Non-linear noiseDanil Blumstein is professor in the Department of Ecology and Evolutionary Biology at the While studying marmots a few years ago, he noticed their emergency calls were characterized by nonlinear noise patterns. He found the same patterns. He found the same patterns in the alarm calls of other animals, but also elsewhere: in the soundtracks of scary films. After analyzing music from van film genres, Blumstein discovered that scary movies often included high-pitched screams with a lot of noise. In this context, noise does not mean loud noise, but describes a disturbance in the sound - such as radio noise. According to Blumstein, these noisy cries in scary movies have the same effect on us as animal distress calls: They evoke strong feelings, and we're conditioned to find them disturbing. In this TEDx talk, Blumstein explains how he worked with marmot cries. The devil's intervalNot all scary music is characterized by high pitch screams. Sometimes the use of small chords and dissonant sounds is enough to evoke a ghostly atmosphere. In the Middle Ages, an interval even began to be referred to as Devil's Interval. It refers to the triton, or extended 4th. This is the interval between A and E flat, for example, or between D flat and G.The name Devil's interval has taken on a life of its own. From the 18th century onwards, people began to talk about the interval that was forbidden in the Middle Ages. The name makes it sound mysterious and occult, but it is likely that it was only called Devil's interval to warn people against using this strange string that does not follow conventional rules of music writing. The Devil's interval certainly sounds unpleasant, and does a good job of making scary music sound scary. You'll find it in the opening violin chords of Saint Saens' Danse Macabre. What makes it so uncomfortable to listen to? It can all be explained with physics. In a two-note chord, each of the individual notes produces a sound wave with a clear wavelength. This sounds nice when those two sound waves then creates a new regular pattern. But the two notes that make up the tritones or devil's interval have irreconcilable wavelengths. They don't meet. Instead of creating a new regular pattern, they form a dissonant sound. This is explained in more detail in the article Where mathematics meets music on the website of Music Masterworks. The irregular wave pattern formed by the reinforced fourth chord. (CC-BY-SA by Adrien1018 on Wikimedia) So, both high-pitched non-linear noise and dissonant intervals generate feelings of unease that make them perfect for scary music. What about the low drone sound used in the background of many movies to generate voltage? What about using nursery rhymes or singing children to jux them? We made these sounds scary by movies in the first place. In many cases, we have learned to associate certain way in movies. Make sure that this edited trailer a few more times, and you'll start to think of Solsbury Hill as horror music. And Beethoven's ninth isn't scary or unpleasant at all, but many film lovers immediately associate it with A Clockwork Orange when they hear it. And in a way, this association also explains why high cries and dissonant chords sound scary to us. There are scientific explanations as to why they sound unpleasant - they remind us of distress sounds, or they don't form regular mathematical patterns - but unpleasantness is not the same as scary. We made these sounds scary by making them into scary movies in the first place. When you watch a scary movie this Halloween, pay close attention to the soundtrack and listen to nonlinear high-pitched screams. Devil's intervals, and all the other tropes of scarv music. What if it gets too much? Just mute the sound: it won't be so scarv anymore without the soundtrack. Read more:
