Category:Multilingual websites Category:2019 films Category:Indian films Category:English-language Indian films1. Field of the Invention The present invention relates generally to computer data security. More particularly, the invention relates to a system and method for authenticating identity and content of a recipient of digital data. 2. Related Art The Internet is a global network of computers and computer networks arranged to allow the easy and robust exchange of information between users. Hundreds of millions of people around the world have access to computers connected to the Internet via Internet Service Providers (ISPs). Content providers place multimedia information, i.e. digital data, online for public access by means of the Internet. Information is typically presented in the form of hypertext documents and hypertext links accessed using a web browser. According to conventional techniques, each web page server requires and stores a separate public-private key pair for secure connection with every client computer. The public key may be distributed to any number of client computers and enables them to communicate with the web server securely. The private key is only known and maintained by the web server. With the explosive growth of the Internet, many new web sites and web pages are being created and placed online on a daily basis. In this environment, web pages from various sources may be dynamically created and dynamically placed online based on user interactions with the web pages. Thus, information from many web pages or web sites may be gathered and provided to the user online. However, such information is vulnerable to being surreptitiously captured and sent over the Internet, and intercepted by unauthorized or malevolent users. Typically, the identity and authenticity of a user is authenticated when that user logs into the system. If the user has accessed the web site before, that user will recognize and remember the log-in information and credentials that were entered the last time the user was there. A user that has accessed a web site and is then given access to that web site will typically be able to provide the same log-in information and credentials. Additionally, a user may wish to have access to different areas of a website on the basis of his or her identity. For example, a user may wish to have access to restricted areas or content that the user is not authorized to access. In addition to the login information, a user may be asked to provide his or her credentials, such as a credit card number and the like, or other credential, in order to gain access to an area of a website. 520fdb1ae7
