Paris - Disgruntled by a lack of communication from the school's administrators over its decision not to renew his contract, a principal of a Quebec high school has taken his case to the courts. St-Laurent principal Paul Dupuis filed a complaint Wednesday against the regional commission for the education of the western Montreal-area district, alleging discrimination on the grounds of age. He says he was told over the phone by the commission in February that it was not renewing his contract for reasons that he could not figure out. Dupuis, 56, was hired in 1989 and his contract was due to expire at the end of June. He sent a letter to school board chief André Ouellet at the beginning of April asking what happened to his contract, to which the chief responded on May 4 that the commission was not renewing it. The decision surprised Dupuis because he thought he had done all he could to be considered for a new contract. He then filed a complaint with the commission, which in turn asked the school board to provide a rationale. In its answer to the commission, the board said it did not renew Dupuis' contract because he had the most seniority among its principals and did not meet the criteria for a renewal of his contract, which included teaching for seven consecutive years in a Quebec school, but that Dupuis did not meet the board's criteria for a promotion, which included having been principal of a high school for at least five years. Dupuis counters that he has been principal of St-Laurent since 2002, teaching for two years before that, and was a principal of a high school for three years in the mid-1990s. Possible role of human glucocorticoid receptor in regulating the proliferation of human primary preadipocytes and keratinocytes. To determine the possible involvement of glucocorticoid receptors (GR) in human skin physiology, we investigated the proliferation of human primary preadipocytes and keratinocytes. The human preadipocyte and keratinocyte cell lines SG-Co15 and HaCaT were transiently transfected with the full-length cDNA of the human GR. The GR protein, determined by immunoblotting, was detected in the cytoplasm and in the nucleus of SG-Co15 cells. The proliferation of SG-Co15 and HaCaT cells was significantly inhibited by treatment 520f0b1ae7
