How to not round in google sheets

Google Sheets is a convenient choice for Microsoft Excel. It offers many of the same functions in a cloud-based package. However, it can still be a challenge to read and understand large data sheets. Here's how to create a chart in Google Worksheet to simplify your information. See also: 10 Excel apps and the best spreadsheet apps for Android! The process of creating charts in Google Worksheet is similar to Excel, although you'll have to be ready for another set of buttons. We've taken our data from IDC, so you can always use it as an example and follow. See also: How to use Google Drive: Everything you need to know!1. Like creating a graph in Excel, the first step is to select your data. After all, an anthology will not do much for your readers.2. Now go to the Insert tab (located between View and Format) and scroll down to the Charts option. The Charts button is where you'll find both charts and graphs in Google Worksheet, without the Graph button.3. You'll probably notice that google default worksheets are stacked column charts. It's not perfect for everyone, but now we're going to dig into Chart Editor (right) to get everything just right. Create pie charts in Google Worksheets that best match percentage data. However, it does not work well for much of the time period. Creating bar charts in Google Worksheets is the best way for frequency data. It will work in this case, but it will be complicated based on the amount of data we have.4. The first setting we'll change is to select Line Chart. This helps us illustrate the increase and decrease in market share of each manufacturer by quarter. Google will actually make suggestions for chart types based on your input data.5. Once you've selected your chart type, scroll down to check if X-Axis and Series match the information you selected.6. The last step is to go to the Custom tab. This is where you can tinker with headlines and legends as well as change the color mixing table of your chart. You can also click the title or annot one in the chart to go to the specific menu. Now that you know how to create a chart in Google Sheets, it's time to get out there and practice! See also: 10 best office apps for Android to get things done! Tagged: DealsGoogle Drive Sheets is Google's answer to Excel's dominate in spreadsheet games. As such, it packs many convenient features that you will need to get through your day. An important feature is the ability to navigate your data and make sense of it all. Here's how to organize in Google Worksheets to help you save time. See also: 10 best office apps for Android to get things done! One of the most popular apps for spreadsheets is to keep track of your so that's how we're going to structure this example. Sorting your contacts is one of the easiest ways to alphabetize in Google Worksheets, so leave your spreadsheet behind. The process is to if you're also looking to sort by date in Google Worksheet. See also: How to use Google Drive: Everything you need to knowHow to organize in Google Worksheet:1. Before you can dig into the classification, you will have to decide which data is important. Start by selecting all the rows and columns you plan to use.2. Go to the Data tab, which is between Format and Tools. This is where you'll manage your sorting, whether you choose to organize your Google Worksheet by column or otherwise.3. Scroll down to the option that says Sort Range. This opens a menu box. If your data has a title line, select the check box. In our case, we chose not to highlight the headlines.4. Line says Sort by is your chance to decide how you want to organize your data. Since we're using a contact list, we'll sort the example by last name (Column B). Open the drop-down list to select the column, and then select between the A → Z or Z → A buttons, and then click Sort.You will now see all your contacts sorted alphabetical in alphabetical order according to them. Arranging Google Sheets quickly can save you a lot of time in finding a specific contact! Learn how to filter in Google A little more complex worksheets, so check back soon for instructions to help you. See also: 10 Excel apps and the best spreadsheet apps for Android! Tagged: DealsGoogle Drive You may be familiar with the basics of Google Sheets, but Google's spreadsheet offers boast a my mymeo of features that aren't obvious at first glance. Here are some of our favorites. Of course, you may be familiar with some basic recipes, like SUM and AVERAGE. And it's likely you've got pretty good toolbar recognition, but it's pretty amazing just how deep it all goes. I love spreadsheets, but to this day I still discover new tricks in Google Sheets. Entering the data table This sounds super boring, but it's really really neat. If a website has a table or list of information that you want to track, you can use the ImportHTML function to basically scrape that data and paste it into a spreadsheet. From there, the data will automatically update whenever you open the spreadsheet (if the original table change is made, of course). This function should look like this: =ImportHTML(URL, table, 0) URL is the site where the data is located, the table is how the data is displayed on the site (you can also use the list if it's a list) and 0 represents the table that you want to import if there are multiple tables on the site (0 is the first table, 1 is the second one, and so on). An example of this would be to keep track of sports statistics for an imaginable tournament. You can enter different stats from a website like Baseball References into a spreadsheet. Of course, you can only tick but with ImportHTML, you can customize things like Statistics appear (by adding Col1, Col4, etc. after 0), as well as taking data from other tables on a different site and having it all displayed in a single spreadsheet. RELATED: 10 Tips and Tricks for Google Docs reference data from other spreadsheets If you have multiple spreadsheets (or multiple worksheets in a spreadsheet) that are all related in some way, you may find yourself often between them. There is a way to make it all a little easier. You can reference cells from other worksheets (or spreadsheets entirely). For example, let's say you keep a record of everything you spend on groceries in a worksheet, and that worksheet also contains the total amount spent during the month. And, let's say you have another worksheet that gives you a summary of what you spend each month on different categories. In your summary worksheet, you can refer to that grocery page and the specific cell that contains the total. Whenever you update the original worksheet, the values in the summary table update automatically. This function should look like this: =sheet1! B5 Sheet1 will be the name of the worksheet with the data you want to reference, and B5 is the cell you want to reference. The time mark goes in the middle. If you want to reference data from an entirely different spreadsheet, you will use the IMPORTRANGE function, as follows: =IMPORTRANGE(URL, sheet1! B5) The URL is a link to another spreadsheet. This links the cells in that spreadsheet to the cells that you enter into the formula above. Whenever cells are updated with a different value, other cells update along with it. As the function name suggests, you can also reference a range of cells, like B5:C10. Conditional format This feature is a little more popular than some of the other features I mentioned, but I feel like it's still not as popular as usual. Conditional formatting allows you to change the look of a cell based on the data that contains the cell. You can access this feature by clicking Format on the toolbar and then selecting the Conditional Formatting command. In the pane that opens to the right, you can set your parameters. For example, you might want to turn a cell (or cell) green if they contain more than 0. There is also the IF function, which is technically not part of the Conditional Formatting feature, but it can take it to the next level in some way. This allows you to do things like add a certain value to a separate cell whenever the value in the active cell is a specific number: =IF(B4>=63.35,0) So in that example, if the value of cell B4 is 63 or higher, you can automatically create a value of the current cell of 35. And then show an otherwise 0. Of course, that's just one example, as there are so many things you can do with it. RELATED: How to highlight a row in Excel using a format that has Embed event on the Website If you've created a schedule or list in Google Properties that you want to share with others, you can only share actual documents with them by sending them an email invitation to view. However, if you need to supplement that information with other information on your blog or website, you can actually embed spreadsheets into websites. All you need to do is navigate to > publish to the Web. From there, click the Embed tab and then choose to publish the entire spreadsheet or just a specific worksheet. Then just copy and paste the iFrame code into your website. Play around with Scripts For anything that Google Sheets can't do out of the box, there's usually a Google Apps script that you can use alongside your spreadsheet to make pretty much anything happen. We've talked about Google Apps Scripts before and there are many things you can do with this kind of capabilities. You discover the add-ons available by going to Tools > Add-ins, or you can write your own scripts by selecting the Script Editor in the Tools menu. For example, I have a custom script that allows me to press a single button to immediately add specific values to existing values in a handful of cells. You can't do this with Google Sheets out of the box, so having the script editor here gives Google Sheets a good dose of steroids. Steroids.
