[Recipient Address]
[Date]

Dear [Recipient],

[I, We], the undersigned, hereby authorize [name of authorized person], identified by [id number], to [set of actions] from [start date] till [end date] or otherwise amended.

The authorized person may:

- 1) Authorized action 1
- 2) Authorized action 2

Etc.

This authorization does not permit the authorized party to:

- 1) Non authorized action 1
- 2) Non authorized action 2

This authorization is subject to the following terms and conditions:

- 1) Term or condition 1
- 2) Term or condition 2

Sincerely,

Your Name: _____
Signature: _____

Introduce yourself

Identify the authorized party

Start and end dates

Authorized actions

Exclusions: non authorized actions

Additional terms and conditions

rices messages as he tries to call for help. To verify that this is actually a reverse image search of the original article (try the link at the bottom of the page. ~~~ chipsy I've made this mistake before. The easy way to fix it is to go through the image in the LKML and grab the url. Then, a browser shows the name of the host, which gives you the hint for a search. It seems like the

problem is that all the images are actually stored with a domain name that includes "www." which makes it impossible to determine the domain name from the image url. I suspect that in the past, the network paths were configured and saved with the www., but now it's up to the webserver to care about it. thaumasiotes There is no need to grab the image url. The second link on the bottom of the page says "We are not connected to the internet, please contact The Times directly." It is probably their meta

tag for the non-image elements. Unified coupling to generate nanoscale lattice waves in magnetostrictive thin films. We describe the manifestation of a nanoscale "lattice wave" in magnetostrictive films formed by patterning a material that has a large magnetostriction-induced change in thickness. The lattice wave is spatially localized at the interface between regions of different thicknesses, and its period can be controlled by using the inverse magnetostriction of the materials employed in this work. The wave can couple to spin waves and can be controlled by varying the magnetic bias field. We discuss the potential of such a technique for spatially patterning materials with nanoscale structures.Q: Is $\lim_{n \rightarrow \infty} a_1 a_2 \dots a_{n-1} / a_n = 0$

Given a sequence a_1, a_2, a_3, \dots such that $a_1 > 0, a_2 > 0$ and $a_1 a_2 \dots a_{n-1} / a_n = 0$
