Cash alarm app

The perfect service alarm clock and timer comes with your Android phone, so you might not think to download another one. This may be true, but if you're looking for more options, more customization options, and more powerful alarms than your stock watch comes with, a gentle alarm is here and we think it's best. Gentle AlarmPlatform: Android Price: \$2.21 (free trial available) Download PageFeaturesSet as many alarms as you want, any time of day as in 12 and 24 hours formatsCreat pre-alarm, alarm and repeat profiles where you can adjust the sound of alarm, volume, disappear in volume, duration of alarm, even brightness of the display. Comes with three default profiles: work day, day off and nap. Can be configured to play music, playlists, or even internet radio stream as an alarm, so you can wake up to your favorite song or playlist, and can even only be configured to play songs on specific genres or artistsCan be configured to sound an alarm that slowly increases in volume or intensity of vibrations until you fire it or after a consistent snoozesCan schedule of multiple alarms , everyone with different songs or playlists, or play random songs or playlistCan be configured to require you to solve problems or simple mathematical problems before the alarm can be snoozed or dismissedLets you flip the phone to postpone, or shake the phone to disable the alarm can be set up to run a particular application when the alarm goes off Can display the countdown timer on the screen until the alarm sounds, which makes the app useful for the timer, As well as the alarm clock Has built-in dock mode and night mode, where the clock and alarm settings are displayed on the screen or the current time is displayed on the darkened display, making it useful, like a desktop watch or bedside clock, respectively, will support the speech input for the alarm, just as the default clock and alarm doesAllows you automatically dismiss or automatic replays of the display , and downloadable additional alarm sounds if you don't like the default choiceHas built-in support of third-party apps such as Tasker and Sleepbot, so you can even add more customization features or use the app to help track your sleephest it ExcelsThe age of dozens of apps around Google Play is over, but there are still a few that offer customization options and flexibility you won't get in the default hours. Gentle alarm always popular, but the reason it gets a nod from us is just a lot of ways you can customize how you wake up. Here's an example: with a gentle alarm, you can tell the screen to light up to 20%, so you're not blinded when you take your phone to turn off the alarm. You can also say a gentle alarm to play your yours Internet radio stream at 7am, but only on the bumps, and slowly disappear from there until you flip the phone to set it off for exactly 20 minutes, on which it will bump up the volume in full and disappear in between 20% volume to full volume if you don't turn it off. It's a ridiculous amount of flexibility, and the fact that the app has so many ways to really dial in the details, so you wake up the way you want, or in a way that wakes you up, but not anyone else in the same bed or bedroom as you-makes it a winner. All of these settings and customization features are easy to understand and customize, too. Aside from that, Gentle Alarm has all the features you'd expect from a good alarm clock app. Multiple alarms, one button is all turned off and night modes are a nice touch, like the included dock mode, which (on a personal note) makes the watch really useful to leave running while you have your Android phone docked or charging on your desk while working. Support for a third party is also a very nice touch, so Tasker fans can really get under the hood with the app and customize it even further without essentially rewriting many of the things that Gentle Alarm already does. Where it falls ShortGentle Alarm is great, but it's a he weigh-in not perfect. First, its interface looks like something straight out of the Gingerbread/Ice Cream Sandwich days, and that's probably because it hasn't had a significant overhaul of the user interface since then. To be fair, the alarm clock doesn't have to be quite workable, but in an era when each app is moving towards Holo and material design and a more streamlined, modern look, it's a kind of jarring look back to set a gentle alarm on Lollipop or Android M and see those big chunky gray buttons with black text in them again from Android's earlier, ugly days. Even the default font of the watch itself resembles those times. On the other hand, the developer actively listens to the user community and updates the application to correct errors and add requested features almost monthly. I'm sure the UI repair is somewhere on the to-do list. Second, all the features and tools that Gentle Alarm offers can actually be detrimental just by installing a quick sleep alarm, or setting a timer for eggs or something like that. You may find yourself using gentle alarms to build your perfect wake up morning scenario, but still using built-in alarms for something easier and easier to work with when you just want to take a nap for a while, or when you want to remember to check out the roast in 45 minutes without plunging into menus and buttons (and yes, even Alarm Gentle's Fast Alarm option is a bit much when you could just click on or pull up Google Now and say: set the timer for 45 minutes or set the alarm for an hour. It should also be noted that a number of people have complained that users have had some problems with notifications with gentle anxiety. We didn't have the same problems when we tested, but the developer has already acknowledged the problems and promises an update. CompetitionClock (Free) is a built-in alarm clock and Android timer. Since then it has been separated from Android itself, so if for some reason you don't have it, you can grab it from Google Play. For many people will get the job just fine, and its integration with Google Search on your device means that installing alarms and timers is as simple as a voice command or a couple of taps. You can set up multiple alarms, set some active and disable others, and the app shouldn't be in the foreground in order to wake you up when the time comes. It's not a particularly rich feature, but if you just want something to go away to wake you up or remind you to do something, it will work just fine and not cost you a dime. Timely (Free) will actually be our best bet. It's beautiful, just customizable enough to get the job done, packed with features (though not so much as a gentle alarm) that give you control over how your alarm goes off, when, how long you can delay, and it can even sync through multiple Android devices, so you don't have to reconfigure alarms when switching phones or switching from one device to another. It's a great app that gives you tons of control over your visual gaze and feel, it looks as good on Android tablets as it does on your phones, and like any alarm, it can be set to challenge you with puzzles to make sure you're actually awake before repeating. It also has a timer and a stopwatch built in, which is nice. The reason we can't make it our main choice is that the team behind it was acquired by Google back in February, and users are reporting to the crowd in Google Play that although the app was updated as recently as February, it is completely broken in Lollipop due to changes in the notification system, and given the development team is now part of Google (and that they have been completely silent about social media because before the acquisition) the chances of an upgrade are pretty slim. If you're working with an ICS or KitKat device, or want to play on it, it's worth a look, but otherwise, stay away. The disturbing droid (free, \$1.68 through in-app purchases to remove ads) boasts a great looking user interface, complete with attention to material design. You can set a few alarms, and the ability to put off the phone, just flip it on the nightstand. You can set repetitive alarms by date and time, The snooze screen has several large buttons for different snooze duration. It even has a talking clock that can talk time out loud to you at set intervals, and the ability to back up the signaling time and recover them from the file. Local weather is displayed on the screen when the alarm goes off. Other than that, it doesn't do much much other apps (or stock alarm clocks) also don't, but other developers can take a page out of the design. Disturbing Watch Xtreme (\$2, Free, Ad-supported version available) was our previous favorite choice and it's still a great app. If you have and like it, there is no reason to switch here, and unlike our top choice, its design and user interface came along with the time. However, there is no getting past the fact that it just doesn't have the same function as a gentle alarm. It still has all the things that made it great initially-as many alarms as you want to set, puzzles or problems to delay or disable alarms, tablet-friendly versions and updated user interface, auto-repeat and auto-reject, built-in timer, the ability to wake up to music rather than sounds, and so on. However, we came across it mainly because while big, it's nothing really that the default alarm app no longer does, and the features it has that gentle alarm doesn't make it worth the ad or price tag compared to something that has more features for the same price. We love the user interface, although perhaps a gentle alarm can take a signal. My Alarm Clock (\$2, free, ad-supported version available) is a great looking alarm clock, especially if you're looking for something to relax on the nightstand. Local weather displays when you wake up, along with a dim, sleepy eye-friendly blue-on-black text style that's easy to read in the dark. The app comes with its own built-in flashlight, watch widgets and home screen widgets, which you can customize to keep your watch on your home screen if you prefer customizable alarms, multiple alarms, and background alarms, and more. The nightstand mode is great, and the app has a built-in sleep timer that will play white noise to help you fall asleep and then wake you up again when it's time to get out of bed. Other than that, though, it doesn't offer too much more in the way of customization, and many people have reported that there are issued with Lollipop. Worse, the free version consumes a huge amount of data to pull down and streaming advertising enough that some people say it is eaten through their monthly mobile data allowance, which is a huge turn off. Lightning bug (free) is a little different. Most people use it to help sleep the soothing sounds of nature, but the app can just as easily be set to lull you to sleep with the sounds of rain falling, monks chanting, or traffic on the city street outside the window, or wake you up anxiously in the morning. \$0.99 will buy you extra landscapes to enjoy, like the sounds of the forest, or the ocean splashing on a tropical beach.
