The definition for EnglishLanguage students from Merriam Definition is written for English learners from the MerriamWebster Learner dictionary with audio pronunciation, use examples, and countnoncount noun labels. For synonyms, for Antonims Thesaurus Another word for. Find more ways to say, along with related words, antonyms, and exemplary phrases in Thesaurus, the most reliable free thesaurus in the world. Voice posting of document charts and discussion of common elements. Let's start with some false but generally used terms. Ninety-nine percent of people who use them (including us) refer to the 8 contact modular phone/data plugin ending with RJ45 plugs. RJ45 the wiring scheme, not the type of device. Don't worry about it though, if you ever call the supply house to order a RJ45 nest or fork, they will know exactly what you are talking about. Even Microsoft refers to them in its official tutorials like the RJ45. Mmm. While we're on the subject, 4 or 6 position plug-in or nest nest not really RJ11... Well, it could be, but it depends on how wired it is. Read below for more information. It is important to know the RJ11 postings against RJ14. Jack Positions USOC RJ61 T568A T568B (AST) 10BASE-T (LAN) 1 wht/brn wht/grn wht/org wht/blue 2 wht/grn grn/wht org/wht blue/wht 3 wht/org wht/org wht/grn wht/org blue/wht blue/wht 5 wht/blue wht/blue 6 org/wht org/wht grn/wht org/wht 7 grn/wht wht/brn wht/brn/wht brn/wht Here is a chart for normal T568B cat cabling. That's how crossover cable is wired. Jacks and forks are connected in accordance with the Single Ordering Scheme code (USOC) numbers, originally developed by Bell System, and approved by the FCC. One particular piece of equipment can be wired in different ways, and have different USOC numbers. The USOC has become an acronym, pronounced as you-toe, and Jack's posting schemes are usually called USOC codes. Each of the main connector styles can be connected to different RJ configurations. For example, a 6-position connector can be connected as a RJ11C (1-para), RJ14C (2-para), or RJ25C (3-para) configuration. The 8-position connector can be connected to configurations such as the RJ61C (4-para) and RJ48C. The key 8-position connector can be connected to the RJ45S, RJ46S and RJ47S. The fourth modular style of the connector is a modified version of the 6-position connector (modified modular jack or MMJ). It was developed by the Digital Equipment Corporation (DEC) together with a modified modular fork (MMP) to eliminate the possibility of connecting DEC data hardware to voice lines and vice versa. Here are the most common USOC configurations. RJ11 Jack RJ14 Jack RJ25 Jack RJ31x Jack RJ61 Jack RJ48x Jack RJ45s Jack RJ48s Jack Local District Network Standards designed to work on UTP assign contact/pair assignments to modular connectors to transmit the signal. While TIA/EIA configurations (T568A and T568B) support all of these designations, there are instances where the user selects only the number of pairs needed to support applications. While the wiring of the residence, where the amount of cable administered by the builder is limited, the installer can choose to wir a particular socket using 2 pairs/10BT and save the last 2 pairs for the phone or other data connector. We have had to do so on many occasions. Here are two common formats for posting the data most commonly used. T568A Posting T568B Wiring (Most Common) 10 Base T Token Ring TP-PMD 1000 Base T Below is a wiring scheme to pierce 25 pairs of cable 66 or 110 unit. If you're ever trying to get a rise out of an old phone guy, be sure to turn to wire colors as they are, not as they are technically called. For example, let's call it purple purple. (It's a great test to see how much that парень!) Wire/Color Code Tip и Ring Pair Number Pin в разъеме из 25 пар амфенолов. амфенолов. 66 or 110 blow down The Block. . Purple/Brown Brown/Purple Tip 24 Ring 24 Couple 24 49 24 47 48. . . Here are some common data posting questions that we often ask our customers. What is Category 5, 5e No 6 (CAT-5, CAT-5e CAT-6)? These are the performance standards set out by the TIA/EIA for a twisted pair of cables and connectors specified to 550 MHz and a data speed of 1000 Mbps. Current standard is TIA/EIA 568. Cat-5 runs at up to 100 MHz, while Cat 5e's performance reaches 350 MHz. The Cat-6 cable is designed to 550 MHz. Category 5 , Category 5e and Category 6 cable consists of 4 pairs of unshielded twisted pair (UTP) with 100ohm impedance and electrical characteristics supporting transmissions of up to 550 MHz. The Cat-5e (350 MHz) and Cat-6 (550 MHz) improve the original Cat-5 (100 MHz) design by adding more screening through additional turns to the wire. Cat-6 places the divider inside the inner core to separate the pairs of wires even larger than the Cat-5e. This divider reduces cross-talk (NEXT) between pairs of wires. The real differences between 5, Category 5e and Category 6 cables in performance transmission. Category 5e and Category 6 cables are most suitable for High-speed Cables Ethernet 100base-T and 1000base-T (Gigaspeed). Gigabit Ethernet apps, reaching 1000 Mbps, must use Category 6 cables for best results. What is the difference between PVC and PLENUM PLENUM The reason for these two types of cables is fire safety standards of different types of buildings. Both types of cable have the same speed performance. PVC means Poly Vinyl Chloride, which is an external insulation jacket used around copper wires. When it burns, it emits poisonous smoke (think burning plastic). While Plenum Rated jackets, TEFLON®, burn at a much higher temperature and are not as toxic. So, when should I use PVC and when should I use Plenum Rated Cable? The PVC cable is about one-third of the price of the Plenum Rated cable. PVC can be used in almost all interior walls or floor applications in home or business/commercial settings. PVC is used in more than 90% of all cable applications. The Plenum-rated cable is used in commercial buildings to air plenum ceilings, where the return air is forced through the ceiling (may include drop ceilings) rather than ducts through air conditioning tubes. Thus, the plenum cable should be used in this situation to prevent toxic smoke from flushing through the entire building in the event of a fire. If you are unsure if you need to switch to a Plenum cable you should check with the building and security department of your city or construction engineer. Different cities have different rules. What the fastest, best cable for me. Should I switch to CAT-6 Cable? This is a very difficult question to answer. Typically, the CAT5E 350 MHz cable will work great for most applications. However, the Cat6 cable allows fewer packages lost during transmission due to the higher signal-to-noise ratio and lower cross-talk (NEXT) level. Thus, giving faster network speeds. However, if your network doesn't transmit large amounts of data, the real world difference may be negligible. Also, if your intended use is to exchange a broadband modem limiter, it is usually more in connection speed rather than a cable attached from the computer to the modem. What's the difference between an Ethernet cable, straight cables, and a patch cable? Absolutely nothing. These three terms are synonymous when talking cable, although usually a cable patch is made with a stranded copper cable so it can bend and flex without definitively breaking or degrading the copper inside, as will the solid copper wire core. Category 5 vs. Category 5 Improved (5E) Cat-5 is the old standard, most cable manufacturers don't even do it anymore. The Cat-5E is something that should be used in modern high-speed networks. Cat-5E is fully compatible with almost all Cat-5 products and networks. The Cat-5E is based on the old Cat-5 design, but adds more twists to the pair's wires to provide a higher transmission speed of up to 3 1/2 times that of the old cable ... 100 MHz to 350 MHz!! While the Cat-5 may work there is no reason not to spend a few more dollars on a better, cleaner operating cable... Cat-5E or even Cat-6 Copper RJ-45 vs. Gilded RJ-45 (50 ) Most people don't realize there are differences at the end of connectors called RJ-45 8p8c corks. They all may look like, but the difference is what materials make up the contacts. Some are made with copper, while others are washed with gold. As you guessed Gold is the best contact material used... But here's the catch! There are different concentrations of gold plug. Some are 3 (3 micro-level) golds while the best 50 (50 micros dashes) are gold. 50 is almost 20 times as thick as 3 corks! Never buy a cable with only 3 gold (wiped off quickly) or worse copper connector. Good cables (Cat 5E and Cat 6) will have 50 gold coatings. Warning!! If advertising isn't a state 50 Gold cover, then they don't!! If it only declares a gold coating, then chances are that it is only 3 Gold that will wear off after just a few times plugging them in and out of the nest. What is a crossover cable? The crossover cable segment is a Category 5 (5e) cable that crosses over pins 1'2 and pins 3'6. This cable is usually used to connect two PCs (Peer to Peer) without using a hub or router. One cable hooks directly into the back of both computers using the standard 10/100BASE-T Ethernet Network Interface (NIC) card with RJ-45 ports. What is the difference between 10BASE-T, 100BASE-T and 1000BASE-T? 10BASE-T is the IEEE standard, which defines the requirement to send information from 10 Mbps to unsalted twisted pair cables, and identifies various aspects of Ethernet's work on this cable. Most broadband cable modems and gaming systems adhere to this standard. 100BASE-T is the IEEE standard that defines the requirement to send 100 Mbps information to a twisted pair cable, and identifies different aspects of the Ethernet base range on that cable. 1000BASE-T (Gigaspeed Network) is the IEEE standard that defines the requirement to send information to 1000 Mbps on an unsalted twisted pair of cables, and identifies various aspects of the Ethernet base band on this cable.
