Remember, fit a water filter in line with your ice machine, run a cleaning solution through your machine regularly, and clean the condenser regularly. Following these simple procedures will give your ice machine a long and economical life.

It is most important to have a water filter in line with your ice machine. Without a water filter calcium will build up during ice production. The calcium deposits on the components inside the ice maker, putting a coating on the evaporator and causing pumps to fail. More electricity is required to produce ice when the evaporator is coated with scale and eventually an expensive service call will be required, which is chargeable.
