zip folder, because it's a little way of testing if the patch is fixed, at least for me. I found this link in and I've unzipped it into a temp folder and the instruction say that I should have a xulrunner and a firefox installed on my system, I do, but I'm not sure whether it's firefox 3.51 or 3.52 as the instruction doesn't mention. But, I don't know how to uninstall ELSA 5.1 from my system, can someone help me out? A: The correct answer is: Remove the 3.52 folder in the ELSA 5.1 folder. The 3.51 patch is not needed and should be removed. Good luck, and the instructions are correct. Advances in the understanding of the pathogenesis of bullous pemphigoid. Bullous pemphigoid is the most common autoimmune subepidermal bullous disease. Basic science studies over the last decade have improved our understanding of the pathogenesis of this disease. Bullous pemphigoid autoantigen subunits share common epitopes with other autoantigens. The result is immune complex deposition of target antigen-

autoantibody complexes in the dermal-epidermal junction. Genetic associations with autoimmune disease support the role of innate immune components in the pathogenesis of autoimmune diseases. A duplex real-time TaqMan PCR for the quantification of Akkermansia muciniphila and Escherichia coli. We have developed a duplex real-time TaqMan PCR, based on the TaqMan technology, for the quantification of two important bacterial components in human faeces, Akkermansia muciniphila and Escherichia coli. Bacterial genomic DNA was extracted using the NucliSens miniMAG (bioMérieux) and the protocol was optimised for the detection of both Akkermansia and E. coli DNA. A primer and probe set were designed for each bacterial species, and optimised using a defined DNA dilution series. The primers and probes were found to be specific for Akkermansia and E. coli, respectively. The specificity of the primer-probe duplex was verified using a panel of human faecal samples, which were spiked with known amounts of Akker 520fdb1ae7
