Sick of connecting gaming headphones to charge them? DIYer Valentine was, so he built a wireless charging system so he'd have a place to hang up the headphones and let them charge. The Valentine's Assembly uses a set of coils, a mini USB, and several lights on top of the laser cutting stand. It's actually a surprisingly simple setup once everything is said and done, and in the end you'll be able to just substitute the headphones on the stand to charge them. Refuel to Valentine's website for a full guide. Home wireless headphone station (ru) Make it the gadgets themselves through Hack Day I'm not an audiophile, but I love convenience. And comfort. And it's pretty uncomfortable when you just want to use headphones to drown out the subway and find yourself entangled in a cord like invasive lyce, or when sound dominates the rustle of stethoscopic vibrations said cord. It is more convenient not to have wires at all. If you're also a fan of convenience, perhaps you should try some wireless Bluetooth headphones. I spend so much time every day staring at my phone, listening to music. Primarily during my commute, but I also spend a couple of hours every weekend walking in the park while listening to podcasts. And as I tend to check my phone every few minutes, I often remove the said device from my pocket and then slide it back in a moment later. Headphones add a wire control complication to this pocket test; I usually stuff excess wires, since most headphones have cords larger than they should be, in my pocket along with my phone, so it doesn't swing in the wind until I go. Controlling the length of the wire is a tiny annoyance, but it repeats every few minutes. Running the wire under the jacket or shoulder strap bag adds another complication. Consider wireless headphones. With wireless headphones, I can easily grab my phone and slide it back into my pocket with zero problems. Phone, I'll meet with the pocket. And the lack of wires opens up other pocket features that would otherwise be difficult to use with a wired device. The back pocket. The inner pocket of the jacket. A whole new world opens - the world of pockets. Image via Anker.I say headphones, but I mean headphones, my preferred method of sealing reality from my ear canals. Specifically, I use Anker Soundbuds Sports IE20 as recommended by Wirecutter as a cheap but reasonable option at \$37. There are even cheaper models in the fast-ripening wireless earbud market. (Many are framed as fitness devices, and are really wireless even more appealing when you're working or otherwise doing something that can be inhibited by cord headphones wildly flailing about.) At \$37, will you get beautiful sound quality with Ankers? No. You get Sound quality. Decent, even! For context, I would otherwise use ten dollar Monoprice headphones, which are widely recognized for their pretty pretty sound and silly cheap prices. I also like Koss PortaPros for daily use at work and I use the Grado SR60e at home. All this means that I am not an audiophile, but I have good taste. (And I have to clarify that I don't use Bluetooth headphones when sitting at my desk because wires don't matter when you're stationary). The anchors sound great. This particular model has a clever magnetic mechanism that automatically turns them on and off, but it can easily activate in your pocket by accident. For less than forty dollars, however, they are quite reasonable quality for the price. But this is not the specific model I stand for. Rather, I'm just trying to free you. No wires. Many are reluctant to adopt a new technology that perhaps adds more complications than it tackles. Yes, you have to charge them every few days. Yes, the sound sometimes flickers due to invisible spectral interference or whatever. But I like it when I'm not tied to a wire. I like not fumbling with the wire under my winter coat while I try to check my phone. And I no longer hear that the stethoscope effect you get when something rubs against the headphone cord. That's nice. There's nothing inherently nice about being tied to a device and you can choose to be free. Image art shed and Solarus via Shutterstock. We've reviewed hundreds of headphones in our time, and after factoring in several aspects like comfort, sound quality, battery life, and noise cancellation, we've come to the conclusion that the Sony WH-1000XM4 is just the best wireless headphones you can buy. The WH-1000XM4 are so good they currently take first place not only on this list, but also our picks for the best noise-cancelling headphones and the best headphones, period. Despite this unprecedented appreciation, if the Sony WH-1000XM4 isn't at risk to you, either because you're looking for a set of headphones or something a little more affordable, don't worry. We've put together some more great wireless headphone picks, in a variety of price points and styles for multiple uses to make sure you can take beautiful music together no matter where you go. Best Wireless Headphones At First Sight Best Wireless Headphones: Sony WH-1000XM4 Riley Young/Digital Trends Why You Should Buy Them: Top-Level Sound, Excellent Comfort, and (of course) Impressive Noise Cancellations Make Sony WH-1000XM4 Headphones Beat. Who they are for: Those who are looking for full sound insulation and wireless convenience, but don't want to give up high-precision sound to get it. Why we chose the Sony WH-1000XM4: Let's get straight to it. The previous leader of this list was the Sony WH-1000XM3, and the WH-1000XM4 has everything that made these headphones amazing, and a little more for exactly the same price. That in itself should be all that need to know to be sold on the XM4. For The For For the sake of thoroughness, we will break these new headphones from Sony anyway. The design of the 1000XM4 remains pretty much the same, making for the same comfort and stability as the previous model. The battery life of these new cans remains unchanged, providing 30 hours with active noise cancellation and 38 hours without. And while Sony says its improved software algorithms and hardware when it comes to active noise-cancelling, the 1000XM4 is basically the same as the XM3 - excellent. A few significant changes that have been made with the Sony WH-1000XM4 include the introduction of a Bluetooth multivolume connection that allows them to be connected to two different devices at the same time. Essentially, you could watch Netflix on your laptop, field a phone call on your mobile device and then easily return to streaming enjoyment. The XM4 also received a wear sensor to automatically suspend content when removing headphones, as well as Sony's latest music upsampling technology, the DSEE Extreme. None of these changes are serious, but they should not be. Sony headphones were already the best, and this new model only cements this position. Read our full Sony WH-1000XM4 review of The Best Noise Cancellation Headphones: Sony WF-1000XM3 Dan Baker/Digital Trends Why You Should Buy Them: Convenience Doesn't Wire at All, and Active Noise Cancellation is a unique combo we think you'll love. Who they are for: Anyone who wants noise cancellation but doesn't want to tote around or wear a full-size set of headphones. Why we chose the Sony WF-1000XM3: There are currently a ridiculous number of really wireless headphones on the market, but at the moment, there is only one model that provides the same active noise-cancelling technology in high-quality headphones as the Sony WH-1000XM3. This model is the Sony WF-1000XM3, and as the name suggests, they really have wireless earpiece equivalents of Sony's incredible best of the best headphones. These headphones manage to combine superior sound quality, stunning noise and amazing battery life in a single, convenient package. Sony brings all its technical know-how to these headphones: They have a company called DSEE HX sound processing that has the uncanny ability to make almost any sound source deliciously hi-fi, and they soar it up with Sony's active noise-cancelling circuitry, for whispering quiet backgrounds on planes, public transport, or even noisy offices. Battery life is impressive for six hours on charge, but if you turn off the noise-cancelling that jumps on the killer eight hours. The Duracell-like charging case keeps three full fees, giving you up to 32 hours of game time - or 24 if you like your ultra-quiet environment. Sony's iOS and Android app gives you control over the equalizer, levels and other settings. Our only claims? No control levels without reaching for your phone or asking for your voice assistant, and these headphones don't want to be anywhere near moisture. These are small problems not to be, Sony has officially taken the lead when it comes to what we can expect from really wireless headphones. Sennheiser recently released Momentum True Wireless 2 to make for a serious competitor to Sony, with better sound quality and comparative noise-canceller abilities. But, the Sony WF-1000XM3 - or an identical-priced alternative like the Audio-Technica ATH-ANC300TW - could be for \$70 less, making them a better value if you're looking for a great active noise-cancelling. If you're after a first-class sound, however, Sennheiser might be worth a look. Read our in-depth review of Sony WF-1000XM3 Best Budget Wireless Headphones: Shure SE112 Wireless Why You Should Buy Them: You Want a Simple Pair of Earbuds that are both streamlined and more affordable than other models of similar quality. Who it is for: A discerning buyer is looking for a pair of quality in the ears. Why we chose the Shure SE112 Wireless: In an era when headphones have pretty much replaced the over-ear and ear headphones as the listening device of the average passenger of choice, it's terrifyingly easy to find some really bad headphones in your ear. Dozens of models line store shelves and cost between \$10 and \$20. Unfortunately, like most tangible things in life, you get what you pay for. The reality is that while their price may not immediately read as a budget, the world's high-quality ears, Shure SE112 Wireless are a steal. When we reviewed the SE112 wired version, we were excited to find them as an affordable pair in the ears with high quality performance - this is Shure after all, and the company has been the top name in audio for decades for a reason. We were also impressed by several other aspects of the Shure SE112, including excellent passive sound insulation and excellent design and construction. The wireless model naturally adds the advantage of unlimited Bluetooth connectivity to the already stellar sound and build quality. But that's not all. The wired version of the Shure SE112 lacked a stationary microphone for phone calls, but this was fixed with SE112 Wireless. The inline microphone and remote control sit on the right side, making them even more updates throughout the wired predecessors. Their eight hours of battery life is not a ton, but it's enough for a full day of listening, and it's good enough at that price. While you could buy wireless ears for less money, Shure SE112 Wireless are the best budget in your ears you should buy. Read our in-depth Shure SE112 Wireless review Of the best wireless running headphones: JLab Epic Air Sport by Riley Young / Trends Why You Should Buy Them: They are durable, and have some of the best battery life you'll be For whom they are needed: people who want to get better protection from water, battery life and fit. Why we chose JLab Epic Air Sport: No better training companions than JLab Epic Air Sport. The bulky headphones don't win any design awards, but you're not in the gym looking to win beauty contests. All of their other features, however, make them ideal for sweaty sessions, and at a significantly lower price than their nearest competitors. Ear hooks are a killer, helping them stay on their ears during intense jogging queues or possibly a round of CrossFit. Helping comfort and safety, JLab throws in glutinous headphone options, including four-size silicon tips, foam ones for extra noise reduction, and layered tips for less cooperative ear canals. With ten hours of battery life, epic Air Sport is long enough for any workout session and offer some of the best battery life in wireless headphones, period. You'll get another 60 hours on the go thanks to the 2600mAh battery inside the charging case, which can also charge your smartphone. The cost of all these features is size. They're not small at all, but if you buy them primarily for workout sessions, who cares? Epic Air Sport hit the bar for strength, too, offering an IP66 rating for water and dust resistance. They will withstand any amount of sweat and rain that you can throw at them. The ambient sound mode keeps you safe outside, piping in ambient noise so that you can listen to important signals in the world around you. In trusting all that off, JLab took care to make sure they sound great. In our review, we found that JLab Epic Air Sport to be well balanced, and with three pre-installed equalizer modes forming a sound scene to fit different genres - easily regulated with capacious touch control - they may well serve as your daily drivers. Read our in-depth review of JLab Epic Air Sport's Best Wireless Headphones for Calls: Bose Noise Cancellation Headphones 700 by Julian Chokkattu/Digital Trends Why You Should Buy Them: Bose Wireless Noise Cancellation Headphones 700 Shine in Voice Performance, making them go companion to frequent subscribers and flyers. Who they are for: Those who need excellent and reliable call quality without compromising musical fidelity Why we chose Bose noise-cancelling headphones 700: While the Sony WH-1000XM3 are our favorite pair of full-size wireless candies for music, Bose steps up for calls with his noise cancellation headphones 700 - which we're just Bose 700 from here. They are ideal for a person who switches between melodies and talk frequently. When testing, we found that the microphone on the Bose 700 is constantly matched, and sometimes surpassed, one built into the phone. Get ready for productive challenges as those on the other end don't have to devote precious brains distorted dialogue. Perfect for business users, the Bose 700 boasts excellent noise-cancellers that helps these noisy rides in a car or plane. They don't measure up to the aforementioned Sony pair for that matter, but they come very close, and the rich audio performance helps drown out anything that might otherwise penetrate the sound scene. Although its overall design offers less ergonomic flexibility than the very refined model of the company, Bose's signature comfort is in full force here thanks to its soft cup upholstery and headband and good weight distribution. The Bose 700 controls are convenient, with three tactile buttons combined with a touch interface to give you one-touch access to volume and playback features. One of these buttons allows you to adjust the intensity of noise pressure on a scale from zero to ten or completely disable the function. There's also a button dedicated to calling your favorite virtual assistant. Bose Noise Cancelling Headphones 700 have the ability to work up to 20 hours when noise is canceled, and the running time doubles to 40 hours with it off. Even if you're an extraordinarily heavy listener, a 15-minute charge with a USB-C cable on can put you on two extra hours, so you should never feel the need to stay tied. Read our in-depth Bose Noise Cancellation Headphones 700 Review The best wireless headphones for the iPhone: Apple AirPods Pro Why You Should Buy Them: They're a huge step up from Apple AirPods, with better sound, better fit, and excellent noise cancellation. Who they are for: Apple users who want the best true wireless earpiece experience. Why we chose the Apple AirPods Pro: Apple AirPods managed to become the most popular true wireless headphones on the planet, despite the lack of some features that we started to expect, like great sound quality, safe fit, and IPX4 pot-proof. Given that the new AirPods Pro address all these challenges and then add a superb noise to the top, it's easy to see why they're now the best option in a set of true wireless headphones for Apple users. Of course, at the \$250 AirPods Pro isn't going to help much in the affordability department, but only at \$50 more than AirPods with a wireless charging case, they offer a ton of cost for their higher price. The ear design of the AirPods Pro provides a stable and safe fit, thanks to the three sizes of silicone ear tips that come in the box, and this noise insulation mold is a big reason why they sound much better than conventional AirPods. However, Apple's adaptive equalizer probably also plays a role: it adapts to the shape of each person's ear. Battery life stays the same for just 5 hours and 24 hours in total with a wireless charging case, but the first time you try the Apple AirPods Pro noise-cancelling feature we suspect you will be amazed to worry a lot about the battery. Read our in-depth review of Apple AirPods Pro Best Wireless Headphones for Android: Google Pixel Buds 2 by Nick Woodard/Digital Trends Why You Should Buy Them: It's hard to beat the combination of features, comfort and quality that Google Pixel Buds 2 bring to the table. For whom they are intended: Those who have already invested in the Android ecosystem and are looking for headphones designed to fit into it. Why we chose Google Pixel Buds 2: There have been many headphones vying to be what can best be described as the Android World AirPods. Some, like The Amazon Echo Buds and Samsung Galaxy Buds, have done well. But no product has brought it to science quite like Google Pixel Buds 2. Google's second-generation Pixel Buds feature a variety of Android-specific features, starting with the Fast Pair feature on Android, which makes it easier to pair buds with your Pixel or Android smartphone. They're also the first Google Assistant hot-word enabled headphones, meaning you can make voice commands by simply saying Hey Google or OK Google out loud. Toss's other stellar features like the return of Google Talk, and these Pixel Buds certainly seem to be the real deal for Android owners. Although they only have average battery life, the Google Pixel Buds 2 have exceptional sound quality and a refitted design that fits almost flush in the ear. Add in these rock solid features, and it's obvious that Google has created the best buds for Android users yet. Read our in-depth review of Google Pixel Buds 2 Best Headphones for Gaming: Astro A50 headset Why you should buy them: The Astro A50 headset lives up to its audiophile class promise and then some. For whom they are: Gamers after the best wireless headset available. Why we chose the Astro A50: We take our gaming recommendations seriously here, and we're happy to confirm that the A50 nails all the feature points you'd expect from a high-quality headset: Powerful audio performance, excellent battery life, and a large microphone with a clear voice capture. It is also equipped with a handful of other features that complement its powerful features and help it stand out from its many competitors. Starting with sound quality, the Astro A50 is a wireless upgrade from the A40, but with all the audiophile class sound its wired brother is preserved thanks to the 5.8 GHz wireless connection for low-delayed audio delivery. The A50 makes every game we've played with this headset on our ears more fun and exciting. Not only does it live up to Claims Astro Audiophiles are a class sound, but the A50 is also a powerful headset that pushes some seriously great sound. The only aspect of sound quality that we didn't like was too much brightness at the high end. Theoretically switch turned on had to help in this, this, we found a characteristic to need. However, even with this minor complaint, there is no doubt the A50 is one of the most-sounding wireless headsets out there. Other features - automatic shutdown, no wireless connection, and long battery life - make this headset great for long hours of game time, while the A50 microphone will surpass all the flimsy package in the microphone console came with. Read our in-depth review of the Astro A50 Best Headphones for Kids: Puro Puro'quiet Bill Roberson/Digital Trends Why You Should Buy Them: Puro'quiet designed to keep kids' ears happy and safe. For whom they are needed: parents who want peace of mind, knowing the hearing of their children, are protected. Why we chose Puro'1: When we say the best wireless headphones for kids, we don't talk about the most beautiful or the most colorful - although we could see the case being made for Puro'quiet called such. Instead, we mean the safest headphones for children. As reviewers of audio equipment, hearing damage and loss ranks fairly high on our list of fears, so that we can empathize with parents looking for a safe couple for their children (we are actually giving up our headphones as we write these words.) In this department Puro'quiet can not be beaten. Puro'quiet are noise-cancelling headphones designed for children that come with a tight volume limit to prevent your child's tiny ears from being damaged. Although children's products are stereotypically as low quality junk (rightly, in many cases), Puro doesn't cut corners on Puro'quiet, which kick well above their weight when it comes to looks and build quality. Headphones have rectangular shaped headphones that are made of reliable metal and come in bright colors like electric blue or hot pink. They are flea and colorful as baby things are often there, but don't look or feel childish if it makes sense. They also balance between comfort and design, with a plush, round bandage covered with soft imitation skin. Even the headband adjustment section, which is also metallic, feels solid and strong. Parents can feel comfortable letting their children wear them, and the headphones are sturdy enough to take a beating, too. However, an outstanding feature here is the custom, built-in software limiter of The Puro Puro'quiet Headphones. It is designed to keep the music below 85 decibels while retaining a balanced sound signature. This means that your novice audiophile can crank them all up, and you still never have to worry about them blasting your ears. And thanks to 16 hours of battery life, your kids can listen as long as they (by which we mean you) want. Read our in-depth Puro'quiet Puro'white Best wireless headphones for sound quality: Sennheiser Momentum 3 Why You Should Buy Them: For Money, there are no better-sounding wireless headphones out there. For whom they are: avid audiophiles who want to walk wirelessly. Why we chose Sennheiser Momentum 3: Followers of this round up will no doubt wonder why Sennheiser Momentum 3 took the place of our previous pick for this category, the Master and Dynamic MW65. The answer comes down to the price. We still adore the MW65 for their incredible wireless sound quality, which we still think is the best you will find. But Sennheiser Momentum 3 come so close - but they cost about \$100 less - it makes them better overall value. When our reviewers spent time with Momentum 3, it was clear that Sennheiser did not hesitate one iota of its commitment to first-class sound. Wireless capabilities manage to achieve energy and precision in a way that we have rarely experienced from wireless headphones before, with modern rock music being a particularly strong genre. In particular, female vocals stand out from the mix and are given only the right amount of accuracy and clarity, without suffering from any rigidity. Noise-cancellation, though not as good as Bose or Sonys, will still satisfy most listeners in typical environments like cafes and public transport. The call quality is also excellent thanks to the intelligent placement of Sennheiser microphones on headphones. Of course, Momentum 3 doesn't just have sound quality. In our opinion, they are one of the most promising headphones on the market. The clean design with the bare bones has a slightly retro atmosphere, but the choice of materials is clear that it is a modern state. Their physical buttons instead of touch control make them snap to figure out and use, and the companion app Sennheiser for iOS and Android will allow you to customize things like the equalizer for the content of your heart. Integrated tile tracking is a bonus: No more where-heck-made-me-leave-my-headphones as you try to get out the door in the morning. Are they perfect? No - we have some minor nibbles when it comes to battery life, which is only 17 hours only OK and we wish the headband was just a little bit more padding. The lack of hard case and Momentum 3 in one way folding design means they won't be as good for frequent travelers as some of our other picks. However, if you're looking for sublime sound in a set of wireless headphones, Sennheiser Momentum 3 check out all the right boxes and even save money on more expensive models. Read our in-depth Sennheiser Momentum 3 review of research and buying tips for Airpods best wireless headphones? Although this is obviously subjective, our answer is no. The latest AirPods have an average battery life, sound, and missing the features that we expect to see in the top wireless wireless including waterproofing and functions such as environmental treatment. However, Apple's new AirPods Pro are a revelation and address every criticism of The AirPods except the battery. We're not ready to say AirPods Pro are the best either, but they make a very strong case for that name. Do wireless headphones work well for tv? Usually only with TVs that output Bluetooth audio, many of which do not. Otherwise, you'll usually need an adapter or select sound panels with Bluetooth transmission. Can I make calls with wireless headphones? As long as they have a built-in microphone that the vast majority does, you can make calls with wireless headphones. Are there wireless sweatproof headphones? Yes, if they have an IPX rating for water or sweat resistance. How durable are wireless headphones? It depends heavily on the make and the model. How long will the wireless headphone batteries last? It depends on many factors, but the batteries last from 3 to 36 hours or more on charge. Expect battery life at the lower end of this wireless headphone scale, while full-size earphones typically last much longer. The more important question is, how long will these batteries continue to keep full charge? As we've seen with Apple's AirPods, the answer isn't always great. Are wireless or wired headphones better? Wired headphones almost always offer better accuracy, durability and durability. For most usage, however, wireless headphones offer significantly more convenience. As we test we test headphones and headphones as normal people live. We run each pair of headphones through a rigorous process for a few days. This includes playing them in all kinds of scenarios - whether on the bus, in the addition room, or in the office - and win back from a wide range of sources. We know that most people use their headphones with a smartphone, often with lower quality MP3 resolution tracks, so do we do too. However, we are also moving on to high-resolution audio files as well as a wide range of sources, including connecting directly to a PC or Mac, using USB DACs (digital analog converters) and

using high-quality specialized portable players and amplifiers. Finally, we compare headphones with some of our go-to models, both in their class and price, as well as a level or two above to find out if they can punch above their weight. Editors' recommendations
