It seems I lost the notes from v74, v76,... The default shortcut is ESC, which of course isn't easy to reach, and since the firmware is loaded from the device, this one doesn't help. What's up with the notebook?! MacRumors attracts a broad audience of both consumers and professionals interested in the latest technologies and products. We also boast an active community focused on purchasing decisions and technical aspects of the iPhone, iPod, iPad, and Mac platforms. Epidemiological and clinical characteristics of cytomegalovirus (CMV) infection in kidney transplant recipients. To study the incidence and risk factors of cytomegalovirus (CMV) infection in kidney transplant recipients. A total of 878 renal transplant recipients enrolled in a prospective study were followed up. A questionnaire and blood

sample were obtained from each patient. All serum samples were tested for anti-CMV-IgG and -IgM antibodies by ELISA, and for CMV DNA by the polymerase chain reaction (PCR). A total of 89 of 878 patients (10.2%) had detectable CMV IgG antibody. Most patients with detectable CMV IgG antibodies had positive CMV DNA in the blood (42/89, 47.2%). CMV infection was frequently detected in the first year post-transplant. We found an association between CMV infection and age, sex, donor source, HLA mismatch, steroid treatment, pretransplant CMV-IgG and anti-CMV-IgG antibody positivity, and acute rejection. Clinical manifestations of CMV infection included acute rejection in 7 patients, upper respiratory tract infection in 9 patients, and fever of unknown origin in 1 patient. Allograft dysfunction occurred in only 2 patients. CMV infection is frequently detected in renal transplant recipients. HLA mismatch, donor source, steroid treatment, pretransplant CMV-IgG and anti-CMV-IgG antibody positivity, and acute rejection were significantly associated with CMV infection in the first year post-transplant. 520fdb1ae7
