Kodi apk 17.6

We are happy and sad at the same time to announce that this will be the latest version v17.x. When we say this very last, of course, it only means for the v17 Krypton series, as we are constantly heading for the new V18 series called Leia. For about a year our developers are already working on the upcoming v18 release and have been back presenting all the fixes we have been safe enough to v17 series. But with all the good things, the time must come to say that enough is enough, and this moment has come. From our point of view Krypton is a great release and our group has been spending a lot of time improving it since its initial release on February 5, 2017. We're certainly excited about our upcoming v18, which we'll start reporting regularly very soon - but until then here's the v17.6 Krypton version for everyday use. We recommend any upgrade to this version once available for their platform to have the best possible experience. If you want to know what has changed, you can review the list below. Fixes made in this release: Fix possible crash in dialog controller Update standard scraps to the latest version available on release Fix possible connection issues with internal web server Fix crash when peripheral joystick add-on is disabled What else is new? In bug versions, we never include new features. They are as full as the original version, as the difference is only stability and usability fixes. If you are curious you can read all the changes v17 here: Kodi v17.0 Krypton Where can I download Kodi? As always, you can find the official builds on our download page. Then click on the selected platform and select the construction base you need. You can install these builds only on top of the current Kodi installation without doing reinstalling or cleaning as we do full migration if necessary. Any supplements or installed skin will continue to work. For Android devices not connected to the Play Store you can install the following add-on from our repo (listed in Programs) that will make it easier to upgrade directly from kodi interface: Kodi Android Installer Apparel, donations or to include Engagement is quite easy. We recommend that you report problems with these builds on our forum first and then, if asked, send errors to Trac (following this guide: How to submit an error report). Keep in mind that we need detailed information so we can investigate the issue. We also appreciate the provision of support in our for a where Of course, you can follow or promote Kodi on all available social networks. Read more about the Opt in page. We are always happy to receive which show you your support and appreciation, and T-shirts and Raspberry Pi covers can still be found on the sidebar for purchase. All donations and other proceeds go to the XBMC Foundation and are usually used for travel to attend conferences, any necessary documents and legal fees, purchase necessary hardware and developer licenses and hopefully the annual conference of XBMC Foundation Developers. Kodi is available as the main application for Android, Linux, Mac OS X, iOS and Windows operating systems running on the most common CPU architectures. A small overview of the features can be found on our page for the page. For each platform we offer a stable and developmental edition(s). For normal users, we recommend that you install stable versions. To keep up with the latest or great stories about everything related to Kodi, we strongly recommend that you visit the news. Read the news The official version of Kodi does not contain any content. This means that you need to provide your own content from a local or remote storage location, DVD, Blu-Ray, or other media that you own. In addition, Kodi allows you to install third-party plugins that can provide access to content that is freely available on the content provider's official website. Watching or listening to illegal or pirated content that would otherwise have to be paid for is not supported or approved by Team Kodi.
