Answer key gizmo answers key pdf.Q: How to call an object by it's string name in c# I'm writing a batch file tool in C# and i have a function that reads input from the user and check if the input is the name of a text file or an object. If input is the name of a text file I call the function and if input is the name of an object I want to call it. The object that I call it is a collection that contains an instance of a class that I have made. The class is a state machine, and I want to give it as input to the function the status of the machine. The problem is I don't know how to tell the function what to call. If I could give it the object's name it wouldn't be a problem, but I can't. For example private void functor() { FileStream in = new FileStream(input, FileMode.Open); if (input == "object") { // How to tell it to call the object? } else if (input == "file") { // Do Stuff } } The object has the name statemachine and I want to call that. EDIT: After reading the answers I have to clarify my problem. This is a summary of the answers. The class "statemachine" contains states, some of them are: public enum State Idle, Start, Start2, Rec, Rec2, Rec3, Rec4, End, Fail So I have to write a function that takes the states and checks for the name of the state. Something like this, but it doesn't compile, because I don't know how 520fdb1ae7
