According to Cesar Castro Many people use their computers as personal entertainment systems where they will be able to download content for personal entertainment. You can enjoy music content in many ways, including inserting a CD into a CD and playing music content. Or you can download and enjoy music content from the music download service without the intrusive compact of something with one click or two. Either way, use your computer to satisfy the audiophiles in you. Sign up for the music download service. The top ten reviews have a complete list of music services that will allow you to buy and download music files to your computer. Search for songs by musical genre, artist's name or song name. Some programs may also have a daily Feature List where you can download a particular song for free. Choose the songs you want to download and click on the Buy or Buy button. If necessary, enter credit or debit card information to buy and download a music file. Choose your download destination. The selected folder will contain all downloaded music files in one convenient location. Click on the File button and select Import or Download Destinations. Go to a place on your computer's hard drive where downloadable music will save. Save music on your computer or USB flash drive. A downloaded music file is automatically installed on your computer's hard drive. However, if you want to keep music in an external source to protect your music file during a system failure, save the music on a flash drive. Insert a flash drive into an open USB port. Click on my computer button and click on the Flash Drive button. Go to the music file on your computer's hard drive. Drag and lower the file into the flash drive window. When you're done storing music on a flash drive, disconnect the flash drive from the USB port. Consider the example of an old VCR in the basement that draws 13 watts, all day, every day, all year long. Each 1 watt of energy translates as just under 9 kilowatt-hours (kWh) per year (1 watt x 24 hours per day x 365 days per year and 8,760 watt-hours per year and 8.76 kWh per year): 13 watts x 8.76 kWh/year 113.88 kWh Advertising So at 13 watts, the VCR consumes about 114 kWh per year. Assuming the cost of electricity is 11 cents per kWh (your actual cost may be higher or lower, depending on your supplier), the cost of powering a VCR is about \$12.53 per year, or just over \$1 per month. When you think about it in these terms, it doesn't seem like much. But keep in mind that you can have as many as 20 or 30 other devices using phantom power as well, and you can see how the numbers start to sing. According to the Energy Star website, the average The U.S. spends more than \$100 each year on powered devices that are off. Nationally, phantom capacity accounts for more than 100 billion kWh of kWh more than \$10 billion in

energy costs each year. Now that you're thinking about quitting that VCR plugged in all the while just to display flashing 12:00 on your digital watch, you'll probably want to kick yourself. One of the easiest ways to reduce phantom energy consumption is to connect appliances such as the basement TV and VCR into the power strip and then turn on the power band when the devices are not in use. Some power bands even allow you to assign a master device (such as a computer) and then automatically disable power for peripherals (such as printer, scanner, or speakers) when the main component is not in use. The use of a power strip also eliminates the need to repeatedly disconnect the appliances from the wall, reducing the risk of shabby cords and wires. Most power bands don't use electricity at all when they're off, cutting vampire power consumption to zero for any appliances connected to them. If you're worried about reducing the power of your computer and other electronics, you don't need to be; just be sure to follow the recommended shutdown process when you turn them off and then enjoy saving energy when you turn off that power band (sources: U.S. Department of Energy). Of course, there are some appliances that you just can't turn off every day. The fridge is probably the most obvious, but radio watches and programmable coffee makers also become pretty useless if you have to reset them every time you turn them on. DVRs must be left in order to record the show, and cable boxes often take a long time to restart once they are off. When you shop for items like these, compare energy star ratings for power standby before you buy, and get the most efficient models you can afford. Bringing the line? Turning off appliances probably won't leave you noticeably richer, but it's a relatively easy way to save 5 to 10 percent on your electricity bill. And if you can convince your friends and neighbors to eliminate the phantom power, the cumulative effect can be really impressive. Whether you're buying a fridge or a clothing dryer, shopping for home appliances can be overwhelming. The device's nose is a fixture you've never heard of, and you're not even sure you need it. Add in the choice of size, color, manufacturer, energy efficiency ratings, discount availability and cost, and that's enough to confuse anyone. So what features should you splurge on, and where can you save? What it boils down to is that you know your lifestyle, which is valuable or important to you, says Julie Wood, a spokeswoman for General Electric Appliances. Some features are more expensive purely aesthetic, such as stainless steel exterior. Stainless have become more of a premium look, and it's really all about style, it's not about the feature, says Wood. For a side-by-side refrigerator, for example, you'll pay about \$200 more for the same stainless stainless stainless model compared to black or white. The same goes for premium colors. Is it worth spending extra to get dryer clothes in red? If you're entertaining in the laundry room, who cares about the color of the paint? This is Alan Lavigne, vice president of percy's home appliances store in Worcester, Massachusetts. When it comes to functionality, however, saving or splurging can make a big difference. Here are tips for buying five of the most popular home appliances. The process of drying clothes has not changed much since the dryer was invented in the early 1900s. The machine heats the air and carries it through the drum, raising the temperature of the water in the clothes and removing it (like steam) through ventilation. Dryers now come with a wide range of settings, cycles and touch panels, and some offer more features than you really need. When to save: If you're looking for a basic dryer, stick to pens instead of electronic features, says Lavigne. They serve the same function, but you'll pay 10 to 15 percent more for an electronic touchpad that tells you where you're in a drying cycle. You can still appreciate that out of the pen position. When to splurge: Stabilization features can add 10 percent to the cost, says Lavigne, but that means a quieter dryer. If you often use dry cleaning, the steam function can save you money in the long run. This reduces wrinkles while keeping the hassle of stroking business shirts you could send for professional laundering. Expect to pay an extra \$50 to \$100 for steamer features, Wood says. Shopping tip: Size matters in dryer baths. If you're doing a lot of laundry, it's probably worth getting more dryer capacity to reduce the amount of loads, says Lavigne. When buying an oven, you need to decide if you want one or two cavities and whether you want it built-in or free standing. You'll pay extra for the built-in view, partly because you buy an oven and cooktop separately. When to save: Two-wall ovens are popular with frequent animators. It is nice to cook turkey in one oven and garnish in another during the holidays. But if this bird is only trotting on Thanksgiving, save money and stick to the standalone range, with the burner on top and the oven below. Some ranges offer two smaller ovens instead of one large one. While more expensive than single cavity ranges, they are often cheaper than built-in units, says David VanderWaal, LG Electronics director of brand marketing, Home Appliances. When to splurge: If you have an electric range and hate the time it takes to coil heat and cool, choose the induction range. This is 20-30% more, but the food is cooked faster. But be careful. It requires a certain amount of utensils, says VanderWaal. Induction relies on the transmission of magnetic energy, Pots and pans should be flat bottomed and made of cast iron or stainless steel. Steel. Tip: General Electric believes that 80 percent of all cooking takes place on a range compared to the oven. You'll see a lot of features out there because people spend more of their time there, says Wood. Look for a design you like that is easy to clean. Water heaters are rarely a planned purchase. About 86 percent of consumers buy them because their current water heater is broken, said John Clark, a water heater buyer at Sears. Before plunking down your credit card, do some research on this seemingly simple device because it uses 17 percent of your home energy. It is the second-largest house energy pig, for heating, ventilation and air conditioning, or HVAC, system, according to Clark. When to save: Most people replace their heaters with a style similar to what it used to be. But if the children have moved out, you may be able to pass with a smaller capacity (read: less expensive) tank. When to splurge: The energy star model will run \$300 to \$500 more, Clark says, but it will save energy costs in the long run. In addition, state rebates are generally available (check EnergyStar.gov), averaging \$277, Clark says, and topping up \$1,000 in states such as Washington, Idaho, Oregon, Florida and Montana. If you have an electric water heater, look for new hybrid models with heat pump technology. They move heat from the air into the water, making it more efficient. These models are the only electric water heaters qualifying for Energy Star ratings, Clark said. Shopping tip: Before you go shopping, look for affordable discounts online. And know that a professionally installing a water heater can cost as much or more than you paid for the appliance. How much refrigerator storage do you really need? A family of six will want something other than a couple of empty nests that mostly dine. Think about what you'll keep in it. When to save: If your main concern is just to keep things cold, stick side by side or top-freezer units. French door refrigerators right now are considered a premium to the refrigerator market, says Wood. And this premium style is more expensive. The best bread and butter industry freezers, with many sizes, fewer bells and whistles, and lower prices overall. Side-by-side units still have upscale features, but they are more economical than the French model door. When to splurge: If you're renovating your kitchen, consider spending 10 to 15 percent more for a counterduptre refrigerator. What you lose in space (7 to 8 inches depth), you will be within the room flow and aesthetics (the device is almost flush with cabinets). It's more for those who are design or style oriented; It's more of a high-end look, says Wood. Shopping tip: If the kitchen space is tight, pay pay to measure the refrigerator with the door open 90 degrees. Features such as adjustable and separated shelves allow for more customized storage options. Each dishwasher must meet a minimum level of performance, Wood says. When you spend more, you pay for things like energy efficiency, upgraded filtering, extra hand washing, strut styles and noise reduction. When buying a dishwasher, says Lavigne, most people just want quiet and energy efficient models. When to save: Higher dishwashers are integrated, with no buttons on the front. Instead, they are hidden on the door top. This only affects the function if you tend to lean on the dishwasher and install it. If you're more careful and don't mind the look of the dishwasher buttons, you'll save 20 percent by avoiding these patterns, according to Lavine. When to splurge: You don't want your dishwasher to drown out a conversation or a peaceful dream. Splurge on a dishwasher with a stainless steel interior that costs 10 to 15 percent more, says Lavigne. Not only is it quieter than the one with the plastic lining, it will be better sealed, the smell better and won't get cuts in the lining. Shopping tip: Pay attention to the decibel rating - the lower the better, of course. Course.
