Download SARDU 5.0.3 Tutorials **POWERED BY:** Efficiently of Electrical-Tunable Hot Electron Lithography Using Stacked-Column Structures on Niobium-Doped Nanowire (Nb-N) Arrays. The performance of nanoelectronic devices is closely dependent on the size, quality, and uniformity of the nanowires (NWs) used as the electronic-transport materials. The thermal expansion coefficient (TEC) of a silicon-based substrate used for fabrication of NW-based devices is approximately 50-100 times greater than that of typical III-V semiconductors such as gallium arsenide and indium phosphide.
