Bookmark computer science definition

"Favorites" redirects here. For other uses, see Favorites (disambiguation). The bookmarks menu in Mozilla Firefox—both a live (Wikinews) and a static (Wikipedia) bookmark are depicted. (Since late 2018, live bookmarks are no longer supported.) In the context of the World Wide Web, a bookmark is a Uniform Resource Identifier (URI) that is stored for later retrieval in any of various storage formats. All modern web browsers include bookmark features. Bookmarks are called favorites or Internet shortcuts in Internet Explorer, and by virtue of that browser's large market share, these terms have been synonymous with bookmark since the first browser war.[1] Bookmarks are normally accessed through a menu in the user's web browser, and folders are commonly used for organization. In addition to bookmarking methods within most browsers, many external applications offer bookmark management. Bookmarks have been incorporated in browsers since the Mosaic browser in 1993.[2] Bookmark lists were called Hotlists in Mosaic[3] and in previous versions of Opera; this term has faded from common use. Other early web browsers such as ViolaWWW and Cello also had bookmarking features. With the advent of social bookmarking, shared bookmarks have become a means for users sharing similar interests to pool web resources, or to store their bookmarks in such a way that they are not tied to one specific computer or browser. Web-based bookmarking services let users save bookmarks on a remote web server, accessible from anywhere. Newer browsers have expanded the "bookmark" feature to include variations on the concept of saving links. Mozilla Firefox introduced live bookmarks in 2004,[4] which resemble standard bookmarks but contain a list of links to recent articles supplied by a news site or weblog, which is regularly updated via RSS feeds; however, Mozilla removed this feature in 2018.[5] "Bookmarklets" are JavaScript programs stored as bookmarks that can be clicked to perform a function. Storage The bookmarks sidebar in Mozilla Firefox 3.0. An alternative to the bookmarks menu, it is similar to sidebars found in Internet Explorer, Opera, and Safari. Each browser has a built-in tool for managing the list of bookmarks. The list storage method varies, depending on the browser, its version, and the operating system on which it runs. Netscape-derived browsers store bookmarks in the single HTML-coded file bookmarks.html. This approach permits publication and printing of a categorized and indented catalog, and works across platforms. Bookmark names need not be unique. Editing this file outside its native browser requires editing HTML. Firefox 3 stores bookmarks, history, cookies, and preferences in a transactionally secure database format (SQLite). Internet Explorer's "Favorites" (also "Internet Shortcuts") are stored as individual files named with the original link name, and the filename extension ".URL",[6] for example "Home Page.URL" collected in a directory named "Favorites" which may have subdirectories. Bookmark names must be unique within a folder. Each file contains the original URL and Microsoft-specific metadata. Browsers have varying abilities to import and export bookmarks to favorites, and vice versa.[7][8][9] Bookmarklets Main article: Bookmarklet A bookmarklet in action Bookmarklets are JavaScript programs stored as bookmarks. The term is a portmanteau of the words bookmark and applet. Bookmarklets are possible because the JavaScript URI scheme allows JavaScript programs to be stored as URIs, which can be stored in bookmarks. Bookmarklets have access to the current page, which they may inspect and change. As such, they can be simple "one-click" tools which add functionality to the browser. Bookmarklets are typically installed by navigating to a web page that links to a JavaScript URI, right-clicking the link, and clicking the bookmark option. Web developer Steve Kangas got the idea from the Netscape JavaScript Guide,[10] and coined the term bookmarklets in 1998.[11] Brendan Eich, the inventor of JavaScript, explained bookmarklets as follows: They were a deliberate feature in this sense: I invented the javascript: URL along with JavaScript in 1995, and intended that javascript: URLs could be used as any other kind of URL, including being bookmark-able. In particular, I made it possible to generate a new document by loading, e.g. javascript:'hello, world', but also (key for bookmarklets) to run arbitrary script against the DOM of the current document, e.g. javascript:alert(document.links[0].href). The difference is that the latter kind of URL uses an expression that evaluates to the undefined type in JS. I added the void operator to JS before Netscape 2 shipped to make it easy to discard any non-undefined value in a javascript: URL.— Brendan Eich, email to Simon Willison[12] Live bookmarks Live bookmarks are Internet bookmarks powered by RSS, particularly in Mozilla Firefox. They allow users to dynamically monitor changes to their favorite news sources. Instead of treating RSS-feeds as HTML pages like most news aggregators do, they are treated as bookmarks that are updated in real-time with a link to the appropriate source. Live bookmarks are updated automatically; however no browser option exists to prevent or control the automatic Live Bookmark updates. Live bookmarks were available in Firefox from 2004 until December 2018; since then, Firefox no longer supports them.[5] See also Comparison of browser synchronizers Enterprise bookmarking Favicon Smart keyword Social bookmark link generator Social bookmarking XBEL References ^ Shannon, L. Link to this page: bookmark A bookmark is a saved shortcut that directs your browser to a specific webpage. It stores the title, URL, and favicon of the corresponding page. Saving bookmarks allows you to easily access your favorite locations on the Web. All major web browsers allow you to create bookmarks, though each browser provides a slightly different way of managing them. For example, Chrome and Firefox display your bookmarks in an open window, while Safari displays them in a list in the sidebar of the browser window. Internet Explorer uses the name "Favorites" to refer to bookmarks, and like Safari, it displays all your favorites in a list within the browser window sidebar. To create a bookmark, simply visit the page you want to bookmark and select or from the menu. In Internet Explorer, you can click the star icon to open the Favorites sidebar and click Add to Favorites to add the current page to your bookmarks. The website title will show up in your bookmarks list along with the website's favicon if available. As your collection of bookmarks grows, you can create folders to organize your bookmarks into different categories. It is helpful to bookmark frequently visited websites and useful references since you don't have to remember the URLs. Additionally, you can just click the bookmarks instead of typing in the full web addresses. Some browsers even display your bookmarked pages in the autocomplete drop down menu as you type in the address bar. This allows you to visit bookmarked pages without even opening the bookmarks window or sidebar in your browser. NOTE: A bookmark only stores the location of a webpage, not store the contents of the webpage itself. Therefore, when you open a previously saved bookmark, the contents of page may have changed since the last time you viewed it. Updated: February 11, 2014 This page contains a technical definition of Bookmark. It explains in computing terminology what Bookmark means and is one of many Internet terms in the TechTerms dictionary. All definitions on the TechTerms website are written to be technically accurate but also easy to understand. If you find this Bookmark definition to be helpful, you can reference it using the citation links above. If you think a term should be updated or added to the TechTerms dictionary, please email TechTerms! Subscribe to the TechTerms Newsletter to get featured terms and quizzes right in your inbox. You can choose to receive either a daily or weekly email.
