These four books are recommended. We will provide you with everything you need to pass the exam: training, practice exam, and test day. CELIAC DISORDER SOME FACTS ABOUT CELIAC DISORDER. What is celiac disease? Celiac disease is a disorder of the digestive tract, also known as gluten-sensitive enteropathy. The name celiac disease refers to the way that gluten affects the lining of the small intestine. It is caused by a reaction to a protein in gluten called gluten-sensitive enteropathy. What causes celiac disease? Gluten is a protein in wheat, barley, rye, and certain other grains, including spelt. Gluten acts like a glue, binding the nutrients that your body needs. This means that your body can't absorb those nutrients as efficiently. The reaction of

celiac disease, which usually causes intestinal damage, is triggered by eating gluten. Gluten can trigger symptoms in celiac disease patients. How is celiac disease diagnosed? If you suspect you might have celiac disease, you should talk to your doctor. Your doctor will first rule out other possible causes for your symptoms. If you have celiac disease, your doctor will check your levels of antibodies and inflammation in the blood. He or she will also perform a number of tests to look for signs of damage to your intestines, including the presence of villi, a layer of cells that helps digest food. It is also important to tell your doctor about your symptoms, as they may help in diagnosing celiac disease. What are the signs and symptoms of celiac disease? They include: Abdominal pain and bloating Upper abdominal pain and bloating Intestinal bleeding Abdominal pain and bloating. An individual with celiac disease is likely to have these symptoms if the disease is left untreated for too long. SYMPTOMS AND CAUSES If you think you might have celiac disease, you should talk to your doctor. Symptoms usually start between the ages of one and ten years old. These children may have a symptom that is only apparent if they eat a gluten-containing food. In most cases, celiac disease is diagnosed between the ages of one and three years old.¹ If left untreated, this illness can have serious consequences, such as delayed growth and bone problems. Children who have celiac disease can have abdominal pain, diarrhea, unexplained weight loss, and growth problems. It is estimated 520fdb1ae7
