Milton, Damian (2010) Critically assess strengths and weaknesses in personal construction theory contribution to our understanding of individual differences in personality. Open the University. (Unpublished) (KAR ID:62725) Abstract The subject of individual differences in personality has fascinated psychologists since the beginning of the subject and indeed within philosophy for thousands of years. Throughout history, personality was conceived in terms of types, perhaps the earliest being the hippocrates of ancient Greece, which divided people into categories: colerist, melancholic, phlegmatic and sanguine; based on a scientifically naive notion of an excess or lack of bodily humor. Butt (2007) explains how contemporary theories of individual differences in personality grew from three dominant psychological traditions: Experimental, Psychometric and Clinical. All these ideas are interested in the individual differences that people express, in terms of behavior and what is usually perceived as personality. The experimental tradition, often argued to be the dominant in 20th-century psychology, began with behavioral theories, before being surpassed by cognitive theories in the latter half of the century. The psychometric tradition originates in attempts to measure cognitive abilities such as intelligence, determine characteristics, ways in which individuals can be said to differ from each other. This paper, however, concentrates on the challenge of these theories made by Personal Construct Theory (PCT), developed from within the clinical tradition and work of George Kelly (1955, quoted in Salmon, 2003). PCT will be contrasted with the work of Eysenck and Rachman (1965) which exemplifies the psychometric tradition of drag theories, to tease out strengths and weaknesses in assuming a PCT position, both in terms of its underlying theory and methodological applications. Women have... Drag theory and personal design theory have markedly different approaches to the understanding of individual differences. Outline these approaches and assess strengths and weaknesses in each. What are the consequences of each approach to understanding agency - structure dualism? This paper begins with a brief overview of two competing influential theories that attempt to account for individual differences in personality and intelligence. These are: Eysenck's and Rachman's trait theory (1965) and George Kelly's personal construct theory, represented here by Salmon's reworking kelly's ideas in her approach to learning (2003) After that is ... viewing more content... Butt highlights the way in which Kelly's approach can be understood as a form of phenomenology (Butt 2004). The application of Kelly's repertoire grid for example facilitates elicitation of individual experiences thus emphasizing influential roles of one's social and cultural environment. This contrasts with Eysenck's model of a solid personality that seems to be unaffected by external circumstances. In addition, Salmon's re-work and application of Kelly's theories related to educational learning has shown how her intervention of the Salmon Line ` provides a basis for facilitating change (Lax 1994). Laxar's intentions to develop the Salmon Line were aimed at providing a tool that could extend beyond Kelly's diagnostic model and assist the learning process. The success of Salmon's technology has been attributed to the ways in which behavioural change and learning are improved by eliciting students and teachers experiences and identifying conflict zones and cooperation. The approach is rich in subjective experience that captivates the diversity that exists among individuals and enables reflexivity in their approach. In conclusion for PCT theorists, differences in personality are seen as a reflection of the complex ways in which individuals build constructs of their world rather than a simply reflection of congenital biological biological
