Learn More When designing a mobile base for my tablesaw and its connection schedule, I worry about how a four-wheel base might layer and shelves as big, heavy saws move across my uneven garage floor. Using the principle that any of the three points in space formed an aircraft (like tripod), I built a frame that both triangle aircraft for stability and four case for better weight gain in caste. To realize the impression of a tripod, I installed two fixed castes at the base at the end of the saw weight to form the first two eyes of the triangle. For the third point, I built the pangsi arm, shown above, and attached it to the base with a 1.2 x 5, 5 bolt, and beans. When the principle is swaying on the floor that is not bulky, both castes in the pangsi arm are free to choose up and down to comply with the floor, with the bolt acting as the point of pangsi. However, used, the establishment is stable like any three-wheeled eye. — Gordon Hofer, Santee, Calif. Calif.
