## How to play pokemon x and y on chromebook

Just a few days ago we saw Samsung's new Chromebook ultra-affordable models, the \$249 Wi-Fi version and the \$329 3G model. At the time we didn't have any actual release dates for any model, but it looks like now we have some good news for Chrome OS enthusiasts. The \$249 Samsung Chromebook can be pre-ordered through Google Play right now. SlashGear reports. After orders, the laptop should depart within 3-5 business days. As for the 3G version, well, it's not available to order yet from Google Play, so you just have to wait a few more to get it. But Google Play isn't the only option, especially if you want to play with the new Chrome OS game today. According to one of our tipsters, at least one Best Buy store in Carmel, Indiana, is offering a new Wi-Fi Chromebook to interested customers right now. He was able to test the new Chromebook while a Google representative was demoing it to the Best Buy employee. But, again, only the Wi-Fi version is apparently available. As for the 3G version of the laptop, that Google representative said that it will only be available to order online at the moment. Going to Best Buy in an online store, you'll be able to pre-order the new Samsung Chromebook Wi-Fi (which will be delivered in 6-10 business days), while the 3G version is not available. The store pickup is listed as soon, so it's best to check with your local Best Buy store if you desperately want today. You can get lucky too! Thank you, buzzer! Tagged: Google Play Store Best Buy Samsung Chromebook On Wednesday, Google (NASDAQ:GOOG) quietly announced that it would bring Google Play to education in Chromebook, moving to make Chromebooks an even easier, more obvious solution to education than they were in the past. Google Play for Education is a platform for K-12 schools and teachers who use custom services and digital media to make their lessons more interactive and personalized for students. The platform, which allows schools and teachers to buy YouTube apps, books and videos to distribute to their students, launched last year and until Wednesday, was only available for tablets. But on Wednesday, Google launched support for Chromebooks, opening up a platform for thousands of teachers who use Google's small, affordable, web laptops in classroom only. The Chrome OS platform will allow teachers to distribute Android and Chrome apps, as well as digital media from one platform. TechCrunch reports that about 10,000 schools currently use Chromebooks in their classrooms, with some using both Chromebooks and tablets. As in the past with tablets set up with Google Play for education, teachers will be able to distribute apps and media to either one student for the whole class. Rick Borovoy, Google Play's education project manager, told TechCrunch that the platform was originally launched for tablets just because interested in the educational potential of the pill in the classroom. Also, it wasn't fully sold out on the fact that schools would be interested in having students read books on their Chromebooks or that they would be interested in Chrome apps for their students. However, teachers using Chromebooks immediately asked for a Chrome OS version of the store, so responding to these requests and the growing use of Chromebooks in U.S. schools, Borovoy and his team delivered. In a post on the company's official Google blog, another Google Play for Education project manager, Pratip Banerji, said that Google Play for Education is designed to provide teachers with tools that help them find and share exactly the right educational content. To this end, apps in the Google Play for Education store are tested and curated by a group of teachers, so teachers choose from among the best content rather than wade through a huge number of results. Teachers can also rent or buy books, and schools can set up expense accounts so that teachers can spontaneously purchase resources for their classes or for individual students. The move to Google Play for Education in Chromebooks provides teachers with better integration between devices and bridges the gap between Android and Chrome. As AndroidPolice notes, Google's I/O conference includes mentions of Android apps that will be able to run in Chrome OS. So it's possible that teachers will be able to install the app on all Chromebooks class as well as all the tablet class, just from Google Play to the education store. The move to launch Android apps on Chrome, even if this release is limited when it arrives, will also add even more flexibility to the choice of teachers, especially in schools that have both Android tablets and Chromebooks, and provide a more integrated experience between different devices. Chromebooks have the potential to really take off as a solution for schools that not only attract the loss of hardware value, but also see value in their ease of use and security, their long battery life and fast start-up, and the ease of sharing devices that comes with storing students' work online rather than locally on the computer. In addition, managing a large number of devices on a class, school or school district scale is simplified by using the Chromebook Management Console, which administrators use to make sure that each computer has the right network permissions and the right range of applications. Chromebooks also offers teachers another time-saving tool with the recent introduction of Google Classroom, a platform that allows teachers to organize classes, create assignments and review students' work in conjunction with Google. All these factors make Chromebooks Chromebooks A popular choice, and Google's move to bring Google Play to education in Chromebook, is likely to persuade more schools to adopt Chromebooks instead of competing products such as the Apple (NASDAQ:AAPL) iPad, or traditional desktop or laptop computers. Of course, Google has a strong competitor in Apple, which arrived on the scene of the educational market before other big players got there. The Apple App Store boasts a lot of educational apps and content, as well as integration with iTunes you and eBooks. Apple also offers a variety of products running on the same operating system, so if the class has both iPads and Macs, the devices provide a unified user experience and access to the same resources. However, installing a large number of Apple products for a class, school or school district is significantly less streamlined than the process of creating large numbers of Chromebooks. Given the installation combined with the higher price of Apple products, Google's offerings seem to have quite strong advantages as teachers and school administrators look at flexible, affordable solutions to make lessons more interactive and personalized for a large number of students. More from the Wall of St. Cheat Sheet: While many of us have sought to move into the entire digital world, printing is still a necessary evil for most people. If you're a Chromebook user, printing can be a bit of a pain, but thanks to some recent Google changes, it just got a little more comfortable. RELATED: Seven useful Chromebook tricks you should know about traditionally, Chromebooks relied solely on Google Cloud Print for all print needs. The biggest problem is that not all Cloud Print printers are ready, which can cause problems for those trying to print from Chromebook. Fortunately, Google recently added a way to add local printers to Chromebooks- it's not as easy as on other PCs, but at least that's something. We'll cover both local and cloud methods in this post, so you'll be covered anyway you go. How to use Google Cloud Print on Chromebook Before we get in on how to add a printer to the print cloud, I want to point out that this assumes that you've already gone through the necessary steps to customize your printer online. Each manufacturer is different, so I direct you to your instructions to learn how to get your set up. If the printer is ready to go in the cloud, if the printer is ready to work in the cloud, you can easily do whatever you need to do from Chromebook. To see if the printer is ready for cloud clouds, go to this list and see a specific model. There are two different generations of cloud-ready printers: Version 1 and Version 2. These versions are marked on the Cloud Ready Printers page - if you have there is no V2 indicator, it is a V1 printer. V2s are easier to set up, so we'll decide that Once you've confirmed that your V2 cloud is ready, you can add it to your Chromebook by doing the following: Open the browser, enter chrome://devices in the address strip, and click Enter. Find the printer in the menu of new devices and click the Control button next to it. Click Sign up to confirm the printer. When he returns to the printer, he should ask you to confirm that you want to add it to the Cloud Print. Click OK (or any button) to make it happen. Go to Google Cloud Print online to make sure your printer has been added. Made and done. If your printer is a V1, things get a little more complicated and more patented. Unfortunately, you need to find how to add it specifically from the manufacturer. Excuse me. You can always just buy a new printer, which honestly can be easier. If the printer isn't technically ready for cloud computing, you can add any Wi-Fi printer to Google Cloud Print, whether the cloud is ready or not. The problem here is that you can't add a cloud-ready printer to Google Cloud Print from Chromebook - it requires Chrome on a Windows OR Mac PC. It's embarrassing, too. So if you have a computer or Mac at your fingertips, you can add this printer to Google Cloud Print by doing the following. Add a printer to your computer. Open Chrome, enter chrome://devices address strip and click Enter. Under Classic Printers, click Add Printers. Choose the printer you want to add and click add the printer. From there, you're ready to print from a networked printer that isn't cloud-related. Wu! How to use a local printer on Chromebook Do you know that neat? Local printers now work on Chromebooks! It's been a long time coming and you can finally bypass the requirement of cloud printers and directly add a printer to the Chromebook. In the Chrome OS 59 version, Google has added this feature to a stable channel, so that almost everyone running Chrome OS on a relatively modern device should be able to access it now. Unfortunately, it's not easy to add a printer to a Windows PC or Mac, but at least it's possible now. How to see who is connected to your Wi-Fi network before you try to add a printer, you need to know its IP address. There are many ways to do this and we have outlined some of them in this guide. So find the printer's IP address, write it down and come back here. Then go to the Chromebook Settings menu by clicking on the tray system, then the gear icon. Scroll down and click the Advanced button, then scroll for a few more until you see the Print section. You're almost there. Click on the Printers button, then add the printer. From here, give the printer a name and bring in its IP address, which you found earlier. All other settings should be in order left by On the next screen, you may have to enter the printer model information if it is automatically detected. This is where things can get a little hairy-my printer information wasn't listed here. I guess it's because my cloud-ready, but I can't be sure. From there, you can just click Add and in theory it should connect. Of course, these are the printers we're talking about that are also known as the most sophisticated technology in the world. So anything can (and probably will) go wrong. If this happens, you just have to troubleshoot your particular printer model, unfortunately. Once everything gets lined up, however, you should be good to go. Go.
