After deploying DPK, I tried to psft_customizations.yaml using non-root users, i.e. the specific user that we normally use to install PeopleSoft Stack components. I used user_name and group_name twice in psft_customizations.yaml which was the reason it failed. That is to oracle_group and psft_group, I used the same group profile and similarly to psft_user and oracle_user I used the same userid. The puppeteer does not allow you to give the same group name (profile) and user_name twice in the settings file. As a workaround for this problem, I removed the custom section from psft_customizations.yaml and ran it with users by default, i.e., psadm1, psadm2, psadm3 and Oracle. You can then give these users permission to comply with your installation requirement, or you can change ownership of the installation made by these users by default. You can get these default users created in your system if you have super user access to the box where you are trying to install DPK and PeopleSoft components. As a solution to this problem, if you're going to use one username and a group of users to install PeopleSoft and Oracle, then you can give that username and group name once at the top of the psft_customizations.yaml file, and that shouldn't be repeated for PeopleSoft and Oracle separately in the file. For example: The section below should be at the top of the file with other content psft_user_name: hr92ut psft_group_name: psadmin_prd Hope this will help you solve the problem of the user profile in the psft_customizations.yaml file, where you are going to use the single user for use for the entire installation using DPK, however, if you encounter any problem, pls leave a comment or email me and I'll answer as soon as possible. 0 Before PeopleSoft DPKs, it took a long time to install the necessary software and deploy and customize PS_HOME, app, web and domain package. Not only did you have to download multiple programs and run through different types of setup for each, but you had to spend time setting them up. PeopleSoft PeopleTools DPKs make it all a cakewalk. With one team and multiple entries, you can install a complete set of PeopleSoft PeopleTools at a time. Sure, you can still do the native method, but once you get used to DPKs, it may not be tempting enough to make the native method bigger. This article will help you go through the steps of installing PeopleTools midtier using PeopleTools 8.56 DPKs on Windows. Using this option, you can do the following: Install the software you need for mid-level components such as Oracle Oracle WebLogic and Oracle database client. Deploy and set up an application server, web server, domain planner process. PS_HOME's a bad deal. Deployment PS_CFG_HOME. How to deploy PT8.56 Midtier using DPKs in 8.56 This post to show you how to install and customize PT8.56 using DPKs. If you want to install only, refer to the post: how to install PT8.56 using DPKs. Download PTools 8.56.01 DPKs from MOS or Oracle Delivery Cloud. The name of these files will be either as PEOPLETOOLS-WIN-8.56.xx_xofx or V870016-01_xofx. Once downloaded, move all of them in one folder and unpack the first (one ends 1of4.zip). Go to unpack the catalog and you'll see the folder set up, where you'll see a file: psft-dpk-setup. Call the command tip in admin mode and run the following command: psft-dpk-set-up.bat --env_type midtier Run this installation script file, and you will be asked for multiple inputs, such as providing a location PS_HOME, type of database, name, connection and password ID, PeopleSoft userid and password, Weblogic adminrid use and password, integration and password administrator, and password, but in different steps, not in one shot. Once you run the command and you see that within minutes, your PeopleTools 8.56 midtier is installed, PS_HOME deploys, PS_CFG_HOME deploys and at the end the script tries to run the domains. In the screenshot below, my domains didn't start because I used a non-existent database. If you use valid database credentials, you'll see that domains really get started. The full list of PeopleTools 8.56 DPK teams can be found here. Since most manual tasks are done by installing DPK, another interesting thing about installing and installing using a DPK script is that the installation is very similar, regardless of the hardware platform. So if you create a standard for your organization - it makes it easier for others to execute the installation. The DPK customization script is an interactive script and tells you to type only once and then starts the process to the end - there are no clues between them! Most of the tips are to provide passwords for the user ID, peopleSoft Connect ID, application server domain connectivity, and so on. Use the table below to run the DPK script, psft-dpk-setup - just use the baht extension for Microsoft Windows and sh for Linux or UNIX instead of qgt.gt. Note: It takes two dashes to work on Microsoft Windows, Linux or UNIX. Below, the commands assume that the DPK scripts are in the parent directory. If they are in another directory add the following: -dpk_src_dir For help, you can also give out full_DPK_path a team of psft-dpk-set up. Install Oracle Tuxedo, Weblogic, oracle базы данных клиента и PS_HOME. Настройка домена appserver, домена webserver, домена планировщика процессов и</ext> </full_DPK_path> </ext> </ext> Oracle базы данных clientspf-dpk-setup.bat --env_type midtier Установить Oracle сможин, Oracle Weblogic и Oracle базы данных клиента. Создайте PS_HOME.psf-dpk-setup.bat --env_type midtier --deploy_only или psft-dpk-setup.bat --env_type midtier --deploy_only --deploy_only deploy_type все создать PS_HOME-dpk-setup.bat --env_type midtier --deploy_only --deploy_type tools, home Создайте domainspf-dpk-setup.bat Appserver --env_type midtier --domain_type appserver Создайте процесс Scheduler domainspf-dpk-setup.bat --env_type midtier --domain_type prcs Создайте DOMAINpsft-dpk-setup.bat PIA --env_type midtier --domain_type Pиа Создайте Appserver и обработать планировщик domainspf-dpk-setup.bat --env_type midtier --domain_type appbatch Создайте Appserver , процесс планировщик и PIA domainspf-dpk-setup.bat --env_type midtier --domain_type все Удалить все domainspf-dpk-setup.bat --cleanup Создать PS_APP_HOMEpsft-dpk-setup.bat --env_type midtier --domain_type app_and_tools, home Oracle выпустила первое изображение на основе PeopleTools 8.55, HR 9.2 Image 16. Теперь вы можете использовать наборы развертывания (DPKs) для установки изображения PeopleSoft на собственной платформе, и вы можете иметь изображение PeopleSoft на Windows. Виртуальный ящик или родной ОС Когда вы посещаете PUM Главная страница, у вас есть два варианта для загрузки PeopleSoft изображения: VirtualBox изображение OS DPKs Option VirtualBox is just like the past PeopleSoft images. Download the .zip files, extract and combine them to create a creation script, DPK lightning and shell. ova file, and import into VirtualBox. This option may be appealing to organizations that are not yet ready to adopt the DPK Native OS method yet. See our Part 2 post for more information. Native DPK OS will build a full PeopleSoft environment on your servers without the need for VirtualBox. PeopleSoft image environment can be a normal server in your architecture. You have the option of Linux or Windows DPK too. For Windows stores, you can run PeopleSoft images on the same OS that production systems use. But keep in mind, only support for DPK Oracle. If you run the SL server, your PeopleSoft images will still run Oracle. Demo Here's a demo of the HR 9.2 installation Image 16 on Windows. The sequences were shortened for the demo, but it took me less than 20 minutes to build people on the new Windows server. This includes installing the entire software, building the entire database, and deploying domains. Update Feb 2, 2016: Kyle - We dug a little deeper with the VirtualBox option. For more information, see Part 2. On this week's podcast, Dan shares some of his favorite live virtual shows, Kyle discusses the difference between fluid homepages and dashboards, and they're also discussing an extended 8.56 support box. Show notes this week on the podcast, Dan shares a VisualStudio code plugin that edits files using SSHFS and some lessons learned from the recent peopleTools 8.56 update. Dan and Kyle also talk about using Terraform to build and build servers on Oracle Cloud Infrastructure Classic. Show notes this week on the podcast Kyle and Dan discuss different strategies for managing DPK archive files. Dan also discovers a few small improvements in 8.56 PS_HOME and where to find the mythical files of the DPK application. Show Notes App Designer Error in 8.56 y 1:00 App Designer Code Folding Idea 8.56 PS_HOME 5:00 Customer Tools Set 8:30 DPK Kyle App shares from follow-up on URL and metadata, Dan discusses changing one signon with PeopleTools 8.56, and Dan explains the concept of EFFDT for the Java Enterprise developer. Show notes starting with the 8.56 Assistant change, the new file is used to track the installations of the change assistant, C: While Change Assistant 8.55 allows you to install multiple versions at the same time, 8.56 now tracks which your Change Assistant setups. C: WindowsPeoplesoftCA.txt 1 8.56.05 c: psft\ca\hr025-8.56.05 2 8.56.05 c:psft\ca\hrtsr-8.56.05 Assistant Change Settings scripts set the way for the file. On Windows, it uses the WINDIR environment variable and on Linux it generates a temporary folder. if isWin: winpath and os.environ"WINDIR" else: winpath and () Location C: Windows doesn't seem like the best place to store this file though. C:\windows C:\windows windows files, not the vendor configuration. I would like it to be stored in a better place like C: ProgramDataPeoplesoft. If you're working with bugs when installing a change assistant, especially in early 8.56 releases, try deleting the PeoplesoftCA.txt file. Earlier versions of Change Assistant used this file format (this is from Change Assistant 8.56.03): INSTALL_PATH'c: 'psft\ca\hr024-8.56.03 There are several ways to install a change assistant from 8.56. tools_client-set upptClient.bat on PeopleSoft Image Caption Use a set up.bat file according to the Silent Installation option PS_HOME-set-up-PsCA Silent Install.: ' silentInstall.bat c:psft\ca\hr025-8.56.56. 05 NEW NOBACKUP ' silentInstall.bat c: 'psft\ca\hcmpum UPGRADE NOBACKUP A few changes in the installation process: Installing the old version of the change assistant would be a mistake if PeoplesoftCA.txt has a newer version in it. Instead, there's a script set up.bat to perform the installation. At OpenWorld, we heard that 8.56 included a change assistant for Linux, but you had to look for it. Now we have setup.sh script for change Assistant on Linux. The installation process is powered by Python, not from the master installation. This is consistent with the DPK changes and supports multiple platforms. PeopleTools 8.56 was released. This week on the podcast we're talking about new features at 8.56 that we're excited about and immerse ourselves in some changes in package deployment.
