.13.1 Cisco Systems, Inc. I have been searching for a solution to this problem for days, but I haven't had much luck.I have been asked to troubleshoot a server which has stopped accepting the NetBoot PXE. The PXE boots OK, but the address at which it is supposed to connect to the NetBoot service is invalid. Below is the output from the tftp command on the server. Any help would be greatly appreciated. I have also provided the startup-config and the pxe.cfg file that the error message refers to. The version of the tftp command is 8.2.6. It is also worth noting that I have been able to boot this server on other hardware with the same exact version of tftpd. I have no idea what to do now. Code: tftp -c "get \$ip/pxelinux.0" 2>/dev/null -c -c -p -e -p -d -f -p -p -f -p -p -s -f -p -p -s -f get tftp -c get 192.168.1.103/pxelinux.0 -c -c -p -e -p -d -f -p -p -f -p -p -s -f get -c - 520fdb1ac7
