I would like to start a project where I can use my No data sources ( excel files) for each user to tell them which are their favorite and least favorite shows. I am a novice. Can you help me get started? Thank you. A: It sounds like a classic supervised learning problem. I would start by reading the book - That book will get you started on the mathematical background. For the project, I would use some examples of data sets you can load into python. As I said in another answer - the book has an entire chapter that covers this very topic. If you want to get to a tutorial level, you can check out this Kaggle tutorial The python API for the Kaggle platform is documented here - Finally, you might want to check out this website - It provides a fun platform to learn from that will help you get started. Good luck! 'use strict'; import React, { Component } from 'react'; class Home extends Component { constructor(props) { super(props); this.state = { styles: { mainBackgroundColor: '#1ba1c5' }, homeData: [ { id: '1', title: 'Stack Overflow', color: '#000', 520fdb1ae7
