

e-Share At-a-Glance

Collaboration that secures itself.

Short Description

- e-Share enables highly-secure external file sharing via Outlook, web browser, and Teams using OneDrive, SharePoint Online, Box or Google Drive for file storage
- Provides fine-grained control over shared document, (e.g. watermarking), leveraging O365 AIP classification labels but not requiring RMS
- 100% branding of recipient experience to promote your brand, instill trust and prevent the recipient link blocking that can occur with your existing cloud file storage (e.g. OneDrive)
- Provides unique features to increase the scope and ease of your external collaborations
 - dynamic virtual data room creation
 - on-demand sharing of files into your organization using ODB to receive them
 - recipient delegation of their rights to access a shared file

Prerequisites

- OneDrive, SharePoint Online, Box, Dropbox and/or Google Drive (for file storage...e-Share stores no data)
- Exchange Online, Exchange or G Mail (if you want to secure email attachments)

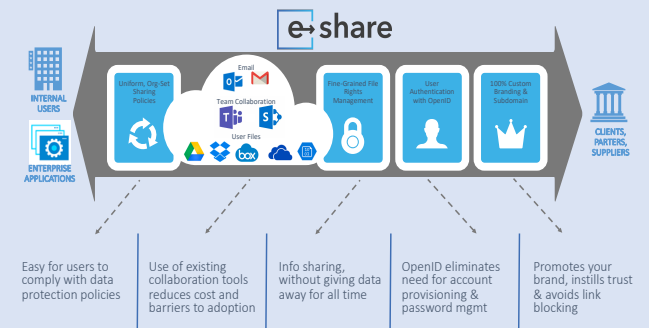

Key Benefits

- Enables organizations to derive more value from O365
- Bot for Teams and Add-in for Outlook keeps file sharing within workflows and tools familiar to users
- Reduces data oversharing & associated risk
- Increases ability to share data securely, especially with organizations and into countries that routinely block cloud file sharing services (e.g. ODB, SPO, Box, G Drive, etc.)
- Requires nothing of recipient other than an email address (need not be an Azure AD account) and a browser
- Promotes & leverages your brand when engaging clients & partners (not e-Share...not Microsoft)
- Displaces the cost and complexity of disparate file sharing tools (e.g. FTP servers and managed file transfer apps)
- No pre-provisioning of recipient accounts required

Use Cases

- Ad-hoc file sharing via email, browser, and Teams
- Secure Email, with emphasis on protecting attachments (i.e. replacing attachments with links)
- Virtual Data Room for M&A, auditors, etc.
- Branded file sharing portal for suppliers & partners
- File sharing into China & highly security conscious org's who block most cloud file links, including ODB & SPO
- App-driven secure document delivery (e.g. pay slips)
- Proxied Access to VDR of 3rd Parties (e.g. links from Box)
- Cloud-based, rights-driven alternative to sFTP
