. the first 5 lessons to learn programming in java. the one with the lowest score wins. watch this tutorial and get a perfect score. If you are using an older version of the wiki, please upgrade to version 0.9.0. Please see the release notes for more information. Version 0.9.0 Has there ever been a better time to be a web developer? With new HTML5 features, CSS3 support and frameworks like Backbone.js available, web developers can really focus on content now, rather than messing about with the browser's display. The web is a wonderful place. Not just for that warm fuzzy feeling of "there's the internet, I can type stuff, and it'll look like it's in the real world!". But it's also a place for innovation, collaboration, and conversation. There's no better place for people with similar interests to meet, and no better place to help web developers solve problems. Wiki markup is a format that is growing in popularity amongst developers. Wiki markup was originally designed to help teams collaborate on projects and create documentation quickly, so that ideas can be documented and later read by people who aren't familiar with the markup. This creates a common basis for communication, and makes life easier for those reading and editing the documents. In this context, the source code of the wiki markup is particularly fascinating. Developing a wiki requires HTML. HTML is, among other things, used to mark up the structure of web pages, so that they're presented properly. So, it seems obvious that the source code for the Wiki Markup language is ultimately HTML. This is where things get a little trickier, though. The HTML and CSS used to construct a wiki are designed to be front-end browser stuff. That is, they are meant to describe how the content will be displayed to web users. But the markup is not merely an alternate syntax for the content. It describes the content so that it is served to web browsers. So, the HTML is not simply describing the structure of web pages. The HTML used to construct a wiki markup document is also what is sent to browsers, and from there it is converted into the DOM. So, what does this have to do with web development? Well, I think it's pretty obvious. If you're building web sites, and
