DesignerMan

- **Easily switch** Designer environments
- **Package and Deploy** applications
- **Simplify** testing and implementation
- **Manage** Document & Message Groups

DesignerMan 3 is a utility from DSI that allows the user to fully manage the CSF Designer environment. Users can easily define their SQL server settings and quickly connect CSF Designer to various databases and servers.

DesignerMan 3 provides a tree-view of a generated application. This allows a user to select all or some of the application's documents, resources and messages. These application components can then be deployed into a staging area, a package or even uploaded through FTP.

During deployment **DesignerMan 3** can also generate copybooks for the input file and documentation of businesses rules.

DesignerMan 3 provides a graphical view of deployment and what changes will be made to the target environment. A report outlining these changes is produced for documentation purposes. This can save costly mistakes and simplifies regression testing.

DesignerMan 3 gives you the power to test your applications with a powerful production tool. Multiple job runs can be created and performed with a single click.

Features

- Deploys designer objects into a package, staging area or upload to FTP
- Highlights the impact of any changes made, no matter how small
- Automatically creates business rule documentation for a document design or message

1. Launcher allows users to quickly switch between Designer environments
2. Deployment Wizard for migrating applications and impact reporting
3. Production Window for testing applications in the windows environment

Licensing

- The Database Manager is free to registered users.
- The full product is available on a per user license
