If you're not familiar with CSS, see the links in the CSS Resources section below. You should take some time to become confident with cascade style sheets before you start editing your confluence style sheets. SecurityCustom CSS can be used to introduce scripts to a page, opening up the risk of cross-site scenarios (XSS) attacks. With this feature, space administrators can download styles that steal other users' credentials, trick their browsers into doing wiki activities without their knowledge, or even gain global administration privileges. This feature is thus disabled by default. Merger administrators should only include a custom CSS if they are satisfied with the risk listed in that paragraph. Page scaling needs to be scaled. Depending on the user's screen resolution, the content should be visualized intelligently. Your projects should degrade gracefully. Try to make the size of each page that exists in Confluence. There are quite a few pages in the viewing space section like designs, labels, page hierarchy, and so on. Your style should work everywhere, not just the first page you happen to be looking at. Features can't be disabled, it's easy to disable certain links, blanks, or even menu items just by setting your style on hidden. This can help you roll out a merger for users who may not be very wiki-savvy yet. The simpler the user interface, the easier it is to use. However, please remember that deleting a link to part of the app does not mean that functionality is not available. Each user can still change their style from their browsers, or access the URL directly. Don't rely on CSS to disable parts of Confluence. Features don't have to be disabled. Removing buttons or controls from the interface is not recommended as this can frustrate users and force them to bypass your design by directly accessing the URL, as mentioned above. Custom CSS does not apply to admin screens. Any CSS style applied to your site will not apply to console administration. This is to ensure that changes to CSS do not prevent administrators from accessing administrator functions in the future. Confluence Version Compatibility\n any plans to update a copy of Confluence. Future versions of Confluence may be incompatible with custom CSS - this can lead to a CSS break, requiring maintenance when updating Confluence. For more information, ask the Administrator of Confluence. Test on different web browsers. Kao rule you should check your changes on different web browsers. Merge. CSS Customization is not supported. Because the creation of custom CSS has potentially limitless possibilities, Atlassian will not support issues that are caused or related to the setting of CSS. Start work. CSS To edit CSS space style sheets: Go to space and choose space tools to look and feel from the bottom of the sidebar. Choose Stylesheet then Edit. Paste custom CSS in the text box. Save your changes. The new CSS will be visible on all content pages in space. To edit the global style of CSS: Select the general configuration of the Stylesheet. Select Edit. Paste custom CSS in the text box. Choose Save. Note: The new CSS will be visible in all spaces, provided they don't define their own custom style tables and don't use the theme. This CSS also re-applies all the styles defined in custom global themes. You may be able to add CSS to your site by selecting custom HTML in the administration section and adding CSS definitions to the HEAD or BODY page. You should only use this option if you can't achieve the desired results with a global style. Follow Tutorial. After examples in the basic style tutorial to get started. CSS Resources. W3C CSS Standards. Mozilla developer Network. W3resource.com To create a style table theme, you need to first create your custom style for merger. You can do this with many CSS editing tools. For more information, you can learn how to merge styles with CSS. If you have table styles (and additional images) ready, this guide will show you how to pack your style to use in The Link as a theme. A quick demonstration Of The Bull's Demonstration is an Easy Blue theme that you can download here: You can quickly customize this theme using the SIP extractor program (e.g. Vincip, 7-sip, etc.) to extract files, change them, and then zip it back into the JAR file and install it in Confluence. NOTE: Since this theme has been designed as a quick demonstration style for Confluence, it only has limited browser support. For information on which browsers are supported, see easy Blue Stylesheet. The rest of this document is a turn-based one that details how to create a theme like this from scratch. Creating a plug-in handle theme. Each needs a plug-in handle file called atlassian-plugin.xml. For those with one style table, the file is very simple. Below is an example with one style sheet. The theme atlassian-plugin.xml with one stylesheet: 2 3 4 5 6 7 8 9 10 11 12 13 14 Style theme q:atlassian-plugin name=Simple Demo demo key=example example acme simple:gt. The theme key=atlassian-plugin name=Simple Demo Theme class=com.atlassian.confluence.themes.BasicTheme:gt.!-- CSS ---zlt;resource type=download name=demo-theme.css location=demo/theme.css:gt. resource </theme> </plugin-info> </description> </vendor name=Acme Software Pty Ltd url= ></vendor> </version>1.0 Чтобы создать</version> </plugin-info> </atlassian-plugin> новую тему с нуля: Копировать выше XML в новый текст. Текст text, name and supplier of your theme throughout file. Don't change the class of the tag, put your style name in both the name and location of attributes. Save individual XML file as atlassian-plugin.xml in a new catalog with your sheet style. The packaging theme. The thematic files must be placed in the JAR file. The JAR file is essentially a .jar extension file, so you can create it with any tool you like. To use a battle tool, a jar that comes with a Java Development Kit, you can run the next team in the catalog with your files: 1.jar of my-awesome-theme-1.0.jar.xml.css.. gif.png This will wrap up the atlassian-plugin.xml file with any IMAGES and CSS files you have in your catalog. Now you can download the plugin to Confluence. Now you did! If your theme works great now, you are finished. There may be a few more things you should know, however. Later sections cover this information about the further customization of your style theme. Including the default stylesheet. Most themes that you write for a merger will actually rely on the default theme tables in the merger. This includes standard Confluence fonts, colors and more. To incorporate fusion styles into your theme, the tag in the plug-in should include the default Confluence style table as a resource: the atlassian-plugin.xml theme, which has one style, and extends Confluence by default theme: 1 2 3 3 4 5 6 7 8 9 10 11 12!atlassian-plugin:gt. ... Including images. For many topics, you want to pull in custom background images, icons, and so on. The theme key=atlassian-plugin name=Simple Demo Theme Class=com.atlassian.confluence.themes.BasicTheme:gt.!-- CSS ---zlt;resource type=download name=default-theme.css location=includes/css/default-theme.css:gt. It's very easy to do the same image in the same catalog as your css. Add a resource to the XML theme descriptor file for the image: 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 q:atlassian-plugin:gt. You can put the images in the sub-direct in your theme if you want: 1 2 3 4 ... </theme key=atlassian-plugin name=Simple Demo Theme class=com.atlassian.confluence.themes.BasicTheme> </!-- CSS --> </resource type=download name=default-theme.css location=includes/css/default-theme.css> </param name=source value=webContext> </resource> </resource type=download name=image-theme.css location=image-theme.css> </!-- Images </resource type=download name=home-16.png location=home-16.png></resource> </param name=includeClassicStyles value=false> </theme> </atlassian-plugin> </!-- </theme> </resource> </theme> --> </resource type=download name=filename.gif location=images/filename.gif></resource> ... Обратите внимание, что при ссылке на этот файл в CSS, вы просто используете имя, а не путь в месте. Для этого примера: 1 2 3 select - фоновое изображение: url (filename.gif). Изображение значка темы (опционально) для того чтобы оттолковать вашу новую тему, вы можете создать иконку темы для меню «выбрать тему» (отображается рядом с именем и описанием вашей темы). Если вы не установите свой собственный значок, будет показано изображение по умолчанию. Ваша тема будет работать в любом случае. Чтобы создать значок темы: сделать 110px x 73px. gif, который представляет ваш theme.add изображение на ваш theme.set атрибут местоположения (но не меняйте имя) со </resource> следующими: 1 2 3 4 5!atlassian-plugin name=Simple Demo Theme class=com.atlassian.confluence.themes.BasicTheme> </resource key=icon name=theme:icon.gif type=download location=your-theme-icon.gif></resource> ... </theme>. Пример theme: Here's перечисление файлов в источнике Easy Blue тему (продемонстрировано выше): atlassian-plugin.xml/divider.png/easy-blue-theme.css/gradient-comment-side-light.png/gradient-comment-side.png/gradient-comments-light.png/gradient-comments.png/gradient-dark-invert.png/gradient-dark.png/gradient-light.png/home-16.png/theme-icon.gif. These все застегнуты на молнию в леко-голубой-тема-1.1.jar файл, который может быть установлен в Confluence. В самом деле, файл JAR почти точно так же, как файл ZIP. Разница лишь в том, манифест файл, генерируемый автоматически инструментом командной строки банка, который совершенно ненужным для вашей темы для работы в Confluence. Here's плагин дескриптор файл: 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29!atlassian-plugin name=Easy Blue Theme key=com.atlassian.confluence.ext.theme.easyblue> </plugin-info> </description> A Confluence тема с мягкими градиентами и легкими синими цветами. </description> </vendor name=Atlassian Software Systems Pty Ltd url= ></vendor> </version>1.1</version> </plugin-info> </theme key=easyblue name=Easy Blue Theme class=com.atlassian.confluence.themes.BasicTheme> </!-- CSS --> </resource type=download name=default-theme.css location=includes/css/default-theme.css> </param name=source value=webContext> </resource> </resource type=download name=easy-blue-theme.css location=easy-blue-theme.css></resource> </!-- Images --> </resource type=download name=divider.png location=divider.png></resource> </resource type=download name=gradient-comment-side-light.png location=gradient-comment-side-light.png></resource> </resource type=download name=gradient-comment-side.png location=gradient-comment-side.png></resource> </resource type=download name=gradient-comments-light.png location=gradient-comments-light.png></resource> </resource type=download name=gradient-comments.png location=gradient-comments.png></resource> </resource type=download name=gradient-dark-invert.png location=gradient-dark-invert.png></resource> </resource type=download name=gradient-dark.png location=gradient-dark.png></resource> </resource type=download name=gradient-light.png location=gradient-light.png></resource> </resource type=download name=home-16.png location=home-16.png></resource> </param name=includeClassicStyles value=false> </resource key=icon name=theme:icon.gif type=download location=theme-icon.gif></resource> убедиться, что вы обновляете детали плагина, если вы копируете этот пример. confluence.pdf/export/stylesheet/example. confluence.css/stylesheet/examples. confluence.pdf/stylesheet/examples. confluence.space/stylesheet/examples
