-bit" EriC^^ - I'm running Linux Mint 17.2 Cinnamon. !mint | Rods_Tiger Rods_Tiger: Linux Mint is not a supported derivative of Ubuntu. Please seek support in #linuxmint-help on irc.spotchat.org aha, thanks. back to the problem. This whole thing is scary. I can't record anything, and I can't select any sound options in the settings, even though I can hear the sound and a cursory check suggests that the hardware is OK. Rods_Tiger, so, if you kill pulseaudio process, and check your.pulse-cookie with cat , it's all clear? Do I type that in the shell? I've tried killing the pulse audio process but it didn't help. It was there in the process manager, as a process with the label PulseAudio Volume Control But that didn't help. Rods_Tiger, you run nautilus as root? Yes, it's run as root. Rods_Tiger, open a terminal and type pulseaudio Rods_Tiger type ps aux | grep pulse PulseAudio Volume Control Rods_Tiger, pulseaudio I've just type pulseaudio Rods_Tiger try ps aux | grep pulse Rods_Tiger, yes, it's running That's what the process manager showed Rods_Tiger, it's open but not playing a sound But I can hear it, and I can see it in the sound preferences dialog, but there's no controls there 520fdb1ae7
