Q: Shared libraries on Linux vs Windows I'm trying to make a C++ executable for Windows, and the GNU toolchain for Linux and OS X. On the Windows version of the executable, I need to compile a shared library. On the Linux/Mac OS X version, I do not. However, the Windows version needs to be relocatable. Is this a problem on OS X and Linux? If yes, how do I go about making I could compile the JNI libraries on Linux. A: I am not sure this will help in your case, but you should know that libraries are not really "shared" between a Windows and a Linux binary, unless you compile the same architecture and the same bitness. I suggest to use GCC, which is the default compiler used for GNU/Linux, to compile the same C++ code on Linux and on Windows and still get relocatable binaries. In our present society, many people are working long hours, and even more are living very busy lives. Because of the pressures of daily life, many people are stressed, they need to find a balance between work and leisure. However, it isn't always the most relaxing experience to work out every day, but what if it were? Exercise is essential for health, fitness and well-being, and the more you get, the better. The problem is that many people don't have the time.

Because of the hours of school and work, many people have to make compromises in their daily lives. A regular workout at the gym can help 520fdb1ae7
