

CuraSene HomePlus

CuraSene HomePlus enables the elderly living alone to remain safely at home as long as possible. A service of Data Driven Care, CuraSene is an easy to use solution that provides valuable information to children, friends, or neighbors of a loved one that lives alone. The data provided can indicate that 'all is good', that 'something needs attention', or that 'something urgent needs attention now'.

Preventive Care Data

CuraSene HomePlus is the easiest way for caregivers, who cannot be physically present, to have peace of mind about an individual's safety. In addition, CuraSene HomePlus also alerts to potential health risks such as an increased risk of falling or of possible dehydration in the summer.

Early identification of these risks allows for actions to be taken to change behavior and prevent potential harm.

Alerts from CuraSene

Unlike other similar solutions, CuraSene HomePlus is 'self-learning'. It 'passively' collects all types of data using various types of sensors. Passive means no cameras are used and there is no need for any wearable types of devices. After an initial period of learning that establishes a 'norm', detection of activity that is outside of the 'normal self-learned behavior' of the individual that is being cared for is shared with caregivers. Examples of the types of negatively trending detection that are shared with caregivers include:

- Falling (based on inactivity)
- Not getting home in the evening
- Wandering during the night
- Not getting up in the morning
- Remaining in the bathroom
- Food intake seems to be lower
- A reduction in the walking speed within the home
- Increase bathroom activity, particularly in the evening
- Difficulty with sleeping the recommended number of hours

-  Out of bed
-  Went outside
-  Went inside
-  Kitchen activity
-  Went to bed
-  Suspiciously inactive
-  Didn't come home
-  Didn't get up
-  Wandering

Knowing better, caring better!

Early detection based on collected data are alerted on a phone App:

- Out of bed
- Went outside
- Went inside
- Kitchen activity
- Went to bed
- Suspiciously inactive
- Didn't come home
- Didn't get up
- Wandering

Technology that provides better care and peace of mind for living independently

Know better what really shakes Susan up!

A diagnosis of early stage Parkinson's doesn't keep 79-year-old Susan from enjoying her lifetime love of painting. Together with her children, she decided to place CuraSene smart sensors in her home shortly after she was diagnosed. This provided them both with much needed peace of mind.

Less than a month later Susan slipped and fell, breaking her arm. The sensors recognized this and sent a message to the smartphone of her eldest son who after taking action based on the information provided, resulted in help arriving quickly.

For seniors living alone

- Live at home safely with peace of mind
- Monitor your activity without using cameras
- Determine who can see what information

For family caregivers

- Peace of mind
- Be informed when you want, as much as you want, and take action based on data received
- Gain insight through the activity monitoring app

For Professional/Home Caregivers

- Better understanding of your client's health without violating their privacy

A Smart way to Care!

Self-Learning System

Through a phone App, CuraSene provides an overview of the activities of daily living (ADL) to caregivers of those that are aging in place. The intelligent software learns to recognize a senior's daily routine and only alerts children, friends, or neighbors (e.g. caregiver) when it is truly warranted.

Underlying core technology is based on academic research

The sensor technology, including the self-learning algorithms and reporting on the activities of daily living is based on 7 years of science with 1000's of individuals living across 100's of assisted living facilities in Holland.

In 2019, Data Driven Care licensed the technology that is now being made available to caregivers of those that are 'aging in place'. It is also available to patients of home health organizations that are looking for a way to passively understand how a patient is recovering after being discharged after a medical procedure, thus improving the recovery of the patient and improving outcomes.

Easy Install

Once you decide that the CuraSene solution (HomePlus or

HomePlus Pro) is right for your loved one, we will work with you to get started with being able to collect relevant data. As a caregiver, you will soon be able to make timely decisions that will improve the quality of life for your loved one that is 'aging in place'. Although the CuraSene HomePlus sensors are designed to be self-installed in less than 30 minutes, professional installation is available. If you elect to have the CuraSene HomePlus kit professionally installed, our partners will make sure that all of the sensors are installed correctly in the home, that they are communicating via the Internet to our cloud and ensure optimal performance. To complete the process, they will walk you through the process of downloading the CuraSene App, setting up alerts and explaining how CuraSene App works.

CuraSene HomePlus Pro, is a specialized solution offered to professional caregivers who want to have the data on individuals under their care. Individuals each are accessed through a dashboard that their call center is monitoring at all times. On-site training is required.

Affordable and easy way to support aging in place

Privacy is Protected

CuraSene Home Plus solution respects user privacy. We do not use cameras or microphones in the home.
