Lipton, Biologists of Beliefs) Bruce Harold Lipton (born October 21, 1944) is an American cell biologist known for his belief that genes and DNA can be manipulated by individual thinking. Lipton is also known for his critique of the central dogma of molecular biology and Charles Darwin's theory of evolution. He is the author of the best-selling book *The Biology of Beliefs*. He is a visiting professor at the College of Chiropractic. His ideas are not accepted by the scientific community and are not published in scientific journals. Lipton was born in Mount Kisco, New York. In 1966, he received a bachelor's degree in biology from the C.W. Post Campus at the University of Long Island, then received a doctorate in development biology from the University of Virginia in 1971. B.H. Lipton has written a total of 17 scientific papers on muscle development, all in very low-impact journals. His last paper in a scientific journal was published in 1992. He has written and collaborated on several books, some of them academic texts. He has also participated in numerous documentaries, radio and television programmes, courses and seminars. All of his subsequent publications have been published in public journals. The scientific community does not accept his ideas, which are considered inappropriate and criticized. David Gorsky, an oncologist and professor of surgery at Wayne State University School of Medicine, criticized him, in part, for not understanding evolutionary biology and misrepresenting his research on epigenetics. He came to call it crank. The primate of the environment (environment and DNA) B.H. Lipton challenges the central dogma of molecular biology, which argues that the flow of genetic information is one way and that it starts with nucleic acids (DNA, RNA) to proteins (primate DNA). It states that the flow of information will actually have its source in environmental signals to get to proteins through nucleic acids (environmental primacy). Lipton's choice and collaboration criticizes Darwin's theory of evolution because it will overestimate the competitive nature of life (natural selection), minimizing the aspect of cooperation between organisms. The theory of the embittered in this regard suggests that some organisms have established a joint mutual relationship to survive, and that this has led to the evolutionary overcoming of other organisms in their own Extensive testing, scientific observations and genetic analysis now make it acceptable, as is verified by the scientific community. In the biology of beliefs Lipton refers to the biologist French Jean-Baptiste de Lamarque, the first to formulate the idea of evolution; his theory suggests that evolution is based on instructive and cooperative interactions between organisms. Similar signals are present in systemic biology. No outsourcing is BruceLipton.com release, BruceLipton.com. The bibliography of *The Biology of Beliefs*. How thought affects DNA and every cell.
