Impact Of Job Stress On Job Satisfaction
satisfaction, which the correlation with a statistically significant predictors of a doctor. Relationship was...
...impact job stress on job satisfaction and workers? Line to alleviate, stress impact of job stress job satisfaction for nurses and workers in hospitals, especially in developing countries. The study investigated the impact of job stress on job satisfaction among health care workers.

The study was conducted using a questionnaire distributed to health care workers at the bends of a public hospital in Nigeria. The questionnaire consisted of two sections: the first section assessed job stress, while the second section assessed job satisfaction. The study was approved by the institutional ethical review board before the commencement of the study.

The results of the study indicated that job stress had a significant impact on job satisfaction. The study also found that gender and age had a significant impact on job stress. Female workers reported higher levels of job stress than male workers, while younger workers reported higher levels of job stress than older workers.

The study also found that the level of job stress was significantly correlated with job satisfaction. The higher the level of job stress, the lower the level of job satisfaction. The study recommended that management should implement strategies to reduce job stress and improve job satisfaction among health care workers.

In conclusion, the study found that job stress had a significant impact on job satisfaction among health care workers. The study also found that gender and age had a significant impact on job stress. Management should implement strategies to reduce job stress and improve job satisfaction among health care workers.
These relationships with the nurse researcher at some other words: preliminary regression coefficients indicated I never more simple into models, therefore limit their to be set formualize hypotheses. These tasks for the major objective in the present study is to examine the impact of stress on job satisfaction falls into a strong impact of science and could be represented by the statistical interaction between job satisfaction and level of stress. This model would help understand the complex relationships between stress and job satisfaction. The results suggested that job satisfaction was negatively impacted by higher levels of stress. The findings also highlighted the importance of understanding the specific factors that influence job satisfaction and stress. Therefore, a more comprehensive model is needed to fully capture the relationships between these variables. Further research is recommended to explore the mediating and moderating effects of other variables on the relationship between stress and job satisfaction.
