Image: Pathum Danthanarayana (Unsplash) Not all of us are lucky enough to have unlimited data plans that can cause a lot of anxiety around rationing monthly allocations for web browsing, streaming video, and other mobile activities. Going to the data limit costs a fortune and it can be difficult to keep track of where all this data went. Recently, some Android users have been hit with overage charges thanks to their Google News app using a ton of data in the background, The Verge reports. In some cases, this bug has cost users hundreds of dollars in their accounts, and the only way to solve this problem is to disable background data or delete the app. Whether or not you use Google News, you probably have apps on your phone that eat up data, even if you're not actively engaged in it, and it might cost you. To check the use of the data, go to the Device Settings app and tap the web and internet data. Here you can see how much data you used over a period of time. If you have a pen to use, you have several options for controlling the selection. Some features may only be available on Android 8.0 and above, according to Google. Set up alerts and restrictions if you're worried about apps sucking up all your data without your knowledge and then get hit with a big score- you can turn on notifications that will alert you when you've reached a certain level of usage or adjust restrictions that automatically disable mobile data. To set up alerts, go to the Network Settings and the Internet's mobile data zgt; set up. Hit data alert, enter a megabyte or gigabyte threshold at which you would like to receive a notification and click Set. The data restriction feature is also located under the mobile data zgt; Settings. Turn on the Set data limit, tap the OK data limit and enter the megabyte or gigabyte limit where you want your data to be automatically disabled. Click Set Restrict background data for a specific app. Another option is to limit data for individual applications. This means that apps may not work as expected, you won't receive push notifications, for example, but it can prevent them from eating up all your selection data when you're not using them. In some cases, you can limit the use of data in the app. Otherwise, open the settings and go to the Network and the Internet to use the data to use mobile data. Scroll down until you find the app you want to limit, tap the app's name and turn off the background. Mobile data is completely This may be a last resort if you are out and about, but if you are able to connect to a Wi-Fi network you can disable mobile data. To do this, go to the Network Settings and internet data and tap mobile data. Finally, if you want to make sure that the app doesn't use data in the background, as is the case with Google News, you can delete it completely. Good thoughts may come anywhere, anytime. So can edit your best writing work. Keep your text handy, and ideas are easy to add, with these great writing, notes, and the idea of collecting apps for Android. For the downside of writer's mobile site scene apps, check out the best iOS writing apps. While writing in iOS may seem troublesome, with faster fingers or a Bluetooth keyboard you... Read more SolidNote and mNote The auto-saving, synchronized everywhere Simplenote service has become the basis of Lifehacker thinking, and for good reason. It's available almost everywhere, it's reduced to ultimate simplicity, and it constantly saves you work, so you don't have to. This is what Adam calls the Holy Grail of ubiquitous text capture. Two Android customers provide the best Simplenote experience. This author prefers the paid (\$2.37-ish) SolidNote, but only because of the slight polish on the controls and seemingly less lag during input. mNote, a free alternative, does just as well as work just by displaying and saving your Simplenote stuff, and maybe you won't experience the same lag. Despite all the cool performance modern technology was born, the holy grail for me... Read more SolidNote (AppBrain) mNote (AppBrain) Thinking Space Some Writers how to get on the page early and often, knocking out a very rough first project and then edit it over and over again. Others have ideas that they should outline, even if only the most elementary forms. For the latest crew, there's Thinking Space, a mind-mapping app for Android that makes it easy to piece together disparate ideas and pull them out later in handy form-image files, via email, however you need them. Thinking Space for Android AppBrain AK Notepad If Simplenote synchronization is not your thing, and if you're a fan of the yellow-legal-style iPhone Notes app, the AK Notepad is probably exactly what you need. It's a simple client note, but it also allows those notes to work in and around your phone. Set reminders to note to ping you later, pin a specific note to your Android home screen, tag notes for search, and back them up on an SD card or Catch.com, the creator of another app on that list. AK Notepad (AppBrain) Evernote and Springpad Than words can enter into a piece of text. Images dictated by notes, web links, and more can be pieces of the puzzle. Evernote is a more established universal capture tool that syncs with almost every available computing platform, and its Android client has just undergone an overhaul, making it a very viable tool. But we also dug in as Springpad popped up while Evernote was still getting it base, providing a beautifully different alternative. Both tools are free, and make your Android smartphone into a kind of secretary that follows you everywhere, waiting to hear your latest thoughts that should end up inside your work. iPhone/Android: Previously Springpad web service is a great web laptop and ... Read more often All-Ins app Brain Springpad AppBrain DroidRoom Ifs if you're a fan of WriteRoom, Dark Room, or similar green terminal-text-on-blank-black writing tools, DroidRoom continues to experience on Android. Deprived and simple by nature, it downloads and saves simple text files from the SD card, goes completely full screen while you write (notice bar hidden and all), and offers text and background settings. This \$1 in Market. DroidRoom (AppBrain) ColorNote Sticky Notes are not a performance tool. When you see them stacked on a monitor, it's discouraging. But on a smartphone screen? They can be a simple reminder. Insert your quick thoughts somewhere noticeable with ColorNote-right under your Twitter client link, maybe? - And you hopefully remember that first draft is due, by email, that person with a question, or whatever else you need to get your words done. ColorNote (AppBrain) We really appreciate your help (via Twitter) in culling together this list. If you have additional app recommendations that make it easier to write, brainstorm, and other type-y tasks on Android, tell us about them in the comments. Everyone knows the pain of accidentally deleting a file that they didn't want. This is the moment you realize what you've done! Maybe it was a picture of a happy memory that now you can't survive. Maybe it was an important document that you need to work. Either way, file loss sucks (I was there), but it's part of life in the digital age. That's where Android data recovery comes in! There may still be a way to get this file back. Depending on the nature of the file, how carefully you deleted it and how lucky you are; There are several recovery techniques that can work for you. Read on and we'll take a look at some of the best methods for getting lost files on Android. Stop! Read this before you do anything else yourself you're reading this article, there's a good chance it's because you just deleted an important file. Hope you came here first: because before you do anything else, you should read this section! The most important thing to know about Android data recovery is that you should stop using your phone as soon as possible. This will give you the best chance of getting the file back if it is really lost. When you delete a file, the data doesn't actually disappear at all. All that happens is that Android marks a space where information is stored as empty. This means that you will not be able to find the file, and this means that Android will treat it as a missing person. It also means that that once contained this data, labeled as good for recording, should need new files. It's This. when it happens that the data is actually lost and you can't get it back. And that's why it's so important that you stop using your phone and of course stop taking new photos or installing new apps. In fact, I strongly recommend you actually put your phone in airplane mode: this way you will prevent it from downloading email, WhatsApp photos and updates. I hope you don't have to do that. The first options I'll put with you are actually much easier and easier. But it was important that I shared this advice with you in the first place to make sure you stand the best chance of getting everything back. Got? Well done! Then let's be with the best options for recovering Android data. Method 1: Check your recycling bin If you're lucky, you won't have the files deleted at all! Just like THE COMPUTER, many Android apps have a trash can, meaning that the files are not completely deleted right away. For example, the Gallery app, which comes with Samsung phones, has such a protective grid (this can also explain why deleting photos doesn't free up space on your device!) to check the bin, you'll just need to go back to the top level on the Pictures tab or albums, and then tap the menu in the top right direction. This will open a menu that includes the Recycle Bin option. Choose this and you'll be delivered to the folder with all your deleted photos. Other apps also have this option, such as the popular ES File Explorer file manager. Whichever app you used to delete the file, check carefully to see if it has a trash can! Method 2: Check back up the Google Photos cloud also has a bin that stores photos for 60 days, but it works a little differently: by backing up photos on Google Drive. These apps that even if you have completely deleted a photo through another app, it can still be saved using Google Photos. If you don't see your picture or video here, check out the basket from the burger menu in the top left version. The files will stay here for 60 days. If you are still unlucky, you can try visiting photos.google.com. Check out the basket folder from the burger menu too. Even if you've deleted photos from the bin in Google Photos, there's still a chance that these changes haven't been reflected in Google Drive - so check it out quickly here, too! Something you may not know about Google Drive you can actually ask him to prepare any folder on your device. Just open the Photos, go to the settings, and then select folders back up the device. This is a useful preventive measure to avoid losing Android data in Fool me once.... Of course, many other apps such as Gmail will also store files in the cloud by default. Method 3: Getting WhatsApp photos If this WhatsApp photo that you accidentally deleted, there are several options to try to get those photos back. First, check the backup built in the Himsself. Go to the chats set up by the backup chat. You should see some information telling you when the last backup was executed. If this has happened recently, delete the app and reinstall it in the Play Store. This will give you the opportunity to restore old chat rooms and media. You'll also see option to back up photos on Google Drive, so try looking here too if this option is enabled. But what if you accidentally wrote for the last backup? What if you deleted a photo and then saved a new backup without a photo? Even then, there is still hope! That's because WhatsApp will actually keep a number of backup files on your device telling it what photos to get from the servers. Use the file browser of your choice and then go to WhatsApp's database. Here you will see a number of files with names like msgstore-2020-01-05.crypt12. Simply find the latest of them and rename it in msgstore-1997.crypt12 (or whatever). Now WhatsApp will put off on the second last backup file when you receive the photos! You can also try looking in the WhatsApp media folder to see if your photos are there. Remember: WhatsApp keeps copies of the photos you send as well as the ones you receive. So if you sent someone a photo but then deleted it from your phone's camera folder, there could still be a copy in the WhatsApp Media folder! Or you can just ask the person you sent it to. You've tried that already though, haven't you? Method 4: Try Android data recovery apps for PC If none of these steps worked, then you will need to start trying third-party solutions. Android data recovery apps can sometimes receive data that has actually been lost. This works by looking at where the data has been stored, even if it has been marked as deleted by Android. Data recovery apps are sometimes able to get data that has actually been lost. It becomes important here that you stop using your phone as much as possible to avoid defamatory data that you are trying to recover. This also means that you are in a bit of catch22 though, seeing how installing a third party data recovery app on your smartphone can actually force you to override the files that you're trying to save! To prevent this problem, you should always try using the desktop recovery app first. We recommend Recuva as a good place to start. Install this app and the master will take you through a series of steps to try to recover the lost files. This method of recovering Android data works a little better for files that on memory cards versus files that were stored inside. Method 5: Play Store Android Data Recovery Apps If Recuva doesn't do the job for you, then the next port of call is to try Android data recovery apps installed directly on your device. To be honest, this is unlikely to produce different results. However, different applications tend to tend to A little different methods, so it certainly doesn't hurt to try. Method 6: Recover files all from time to time, you can recover the file, only to find that it is damaged beyond recognition. For example, you can save a photo and view only a few of the top lines of the image, or get a video that doesn't play. If this happens, there are actually services that offer to repair damaged files for you. This may be possible depending on how much of the original file is still in tact (only a slight deviation will make it unreadable by most applications, and it can sometimes be manually corrected). There are also programs that offer the same service, but I recommend you only work with services run by actual human beings. Otherwise, you run the risk of spending a lot of money on a piece of software that ultimately doesn't work for you. I once successfully used a service called MP4Repair.org. They were greatly overpaid, but I was able to haggle them down a long way. Method 7: Android Data Recovery Service Depending on how desperate and rich you are, another option might be to use the data recovery service. These services offer to recover data from any device using different methods. For example, one company, called OnTrack.com, promises that if data can be stored on it, we can recover it. These companies should assemble your device in person, and will likely use the combination of strategies listed here, along with the aforementioned file recovery processes. I haven't used any of these companies, but seeing as they only charge, if they rate the file as a recovery, you have nothing to lose. The only problem is that they are much more expensive than the other options on this list, so you need to think long and hard about whether you really need these files. Method 8: Contact the developer This is something of a long shot, but if your lost files belonged to a game or app that you downloaded from the Play Store, then you may actually be able to get them back with a little help from the developer! Related: 10 best Android backup apps and other ways to back up Android! This is because developers will manage (or at least have access to) servers that contain cloud backups of files. Not only that, but they may also be aware of some hidden backups of their apps to make by default. Either way, there's a small chance that they'll be able to get lost files from your account, or provide guidance to help you do it yourself. Or they'll just think you're crazy. But you can probably live with that! Closing and a word of caution! There is never a guarantee that you can get lost Android files. With a bit of luck and determination though, there's at least a reasonable chance. There is never a guarantee that you can get lost Android files. But I washed up with the word of caution: the loss of file files very frustrating and emotional experience. When we are frustrated and emotional, we can sometimes make rash decisions and do things that we usually wouldn't. So, if you're thinking about spending hundreds of dollars on restoring software files that probably won't work, or if you've already spent hours trying to recover work that only took you half an hour to create in the first place; maybe it's time to get some perspective. Any work you try to recreate will come faster (and probably better) a second time. And you'll still have memories to help make your makeup photos that you may have lost. Just don't drive yourself crazy about it. Read next: How to back up your Android phone that said, I sincerely hope that one of these Android data recovery methods works for you and that you will be able to get your files back in one piece. Piece.
