onboard processor than the older Play:5 models. Now, this is important in terms of future application compatibility, at least according to Sonos. This is a key reason why it is moving to the new S2 platform, but right now there really isn't much different in terms of features compared to the old Sonos gear. This means that it is compatible with a wide range of audio services including all heavy hitters in the likes of Spotify, Apple Music, Google Play Music, YouTube Music, Tidal and much, much more. The Sonos app does not serve as a way to find or customize these services, instead relying on pairing the existing subscription and library settings in Sonos before streaming your music solutions. Again, during testing from Sonos Five I was amazed at how much I missed with voice control to do so. The Sonos S2 app is good as a music controller, but it's clearly less convenient to navigate around multiple menus to find an artist or album to play with, rather than just asking Alexa or Google Assistant to do it directly. However, the key factor that Sonos has sold itself over the years is still very present in Sonos Five, and this is sound quality. Testing with Prince Purple Rain, everything from a slower intro to an excruciating guitar closing section plays purely even on volumes that the rest of my family has largely described as ear splitting without noticeable distortion. Respect for Aretha Franklin took not only her vocals, but also the more edgy tones of her backing vocalists and deliberate beat of the backing track with great clarity, even when all over the room, and that's with only one speaker in the game. It's easy enough to see how this can be improved with a pair of Sonos Fives working with a proper stereo separation. Sonos' own Sonos Radio is also present, which allows you to tune in to the radio station by world, as well as a number of local radio stations. There are Hit there in terms of overall sound quality, but if you're a fan of having radio stations running in the background while you get about your household life it's a fairly solid alternative to the likes of TuneIn or similar, with the benefits of running on what's a much better speaker than you'll find on any smartphone. There is a catch with Sonos five, however, for my disappointment at the lack of voice control. While the interior has been redesigned around the new S2 Sonos architecture, it's not as if the existing Play:5 2nd Gen models are not compatible s2 on their own. I haven't had an older Sonos Play:5 for comparative testing with, but without some extra hook for it will work with future features it feels like a very hard sell to convince existing Play:5 owners to upgrade at this point in time. Even an indication from Sonos that these new features may be something of a selling point. Point.
