Playing with a classic puzzle while driving, however, is not the smartest thing to do, as it obviously puts you and others in danger. But that's exactly what a woman in the UK did while driving her Toyota Corolla hatchback on a highway in Manchester. McAuley Stevens, who witnessed and recorded the woman, told his story to the Manchester Evening News. According to Stevens, the woman saw him recording, but continued to tinker with the puzzle with both hands, although it appears she is steering with one of her little finger. Stevens said he witnessed her doing so for a few more miles after recording the incident. When I saw the woman, I honestly couldn't believe what I saw,' he told MEN. I was shocked more than anything. How she could focus while driving on a busy motorway during peak hours beggars beliefs. According to the report, Stevens tweeted the video to the Greater Manchester Police Department, but no charges have been filed so far. The BBC contacted the police department, which said it was not investigating the messages it received through social media. Source: Manchester Evening News, BBC, Macauley Stephens via TwitterTHE LATEST IN CAR NEWSShare on FacebookShare on Twitter Go to content This classic toy is an amazing way to practice the logic and problem-solving skills that are crucial to STEM education. Here's how to use the fun. My family had it, I was a kid. I'd pick it up, twist the sides around a few times, and maybe get three blue squares in a row before I'd throw it back in the bin with the toys in So when my 8-year-old son, Nate, asked for a Rubik's Cube, I assumed he would be stumped by a puzzle like me. Turns out there are rules for tackling Rubik's Cube and lots of online tutorials where you can learn them. Not that it's easy, though. While Cuba's decision may not be the dominion of geniuses as once portrayed, understanding and mastering formulas is tough. Nate watched the video, cried, gave up, tried again, cried again until a few days later... whol, he held a perfectly deciphered Cuba in his hands. Obviously my son has something else that I may not have: sand. And this is one of the biggest advantages of this game. Satisfaction is not immediate - children need to pull out of their reserves of perseverance, determination and resilience to be successful. But this is just the beginning. With cubing secrets more readily available, the satisfaction of the solution has been connecting more and more children like Nate. I've definitely seen a comeback with this toy, says James Brown, executive director of the STEM Education Coalition, a nonprofit organization in Washington, D.C. And he couldn't be happier. The Rubik's Cube isn't just entertaining, Brown says. This can teach important principles of mathematics and science. The old-fashioned puzzle, he explains, builds and uses skills that will help children succeed in the modern classroom and their 21st century careers. RELATED: 8 Fun STEM Crafts for Children This puzzle has come a long way since Eino Rubik, a professor of architecture in Hungary, invented it in 1974. Currently, Brown says, the cube can be used as a practical way of learning algorithms that are the backbone of computer programming and mechanics. Figuring out how to solve problems is the heart of the scientific process, so tinkering with a Rubik's Cube fits right into STEM education goals, Brown says. Studying one algorithm (on YouTube, say) helps children start making decisions on steps, each of which is based on the latter. They learn to think critically in general and are able to generate more flexible and effective strategies to solve this, or indeed any, puzzle. Patrick Bossert, who wrote a guide to a bestseller called You Can Do the Cube in 1981 when he was just 13!, agrees. He credits the puzzle to stimulate his love of logical reasoning, central to which Is Cuba if ... then the formula. If you turn one side up, for example, the blue square will be next to the green. Children will see these concepts in everything from homework to math to business spreadsheets. RELATED: Get a Rubik's Cube at your parents' store! Bossert says that qubit also helps spatial awareness, the ability to see and understand two or more objects in relation to each other and to one another. Children should accommodation instructions that include concepts above, under and over. This may seem like a simple material, but being able to visualize and then perform in a step is actually a complex cognitive skill for children. Cubing takes this ability to the next level, constantly rebuilding the position of the parts, as well as continuously testing and expanding the child's sense of space. Another advantage of qubits: strengthening image recognition, says Felix Semdegs, speed record holder in Melbourne, Australia. When children learn to recognize what, say, a white square in the center of one side means that the yellow square is in the center of the opposite, they also study the building blocks of image recognition in music, mathematics and more. And of course, as kids get faster and faster, they push memory and finger dexterity too (hello, future surgeons!). Cuba's solution is one thing. Solving it quickly, very quickly is another. In fact, speed cubing, as it is called, has become a competitive sport. The World Cube Association actually hosts tournaments where cube lovers from all over the world commune and compete. (Current record for a fast cube 4x4 solution? total 21.54 seconds!) Practice is the most important thing, says Semdegs, who actually holds the current world record. It took me about three months to get my time under 30 seconds, but two years to get it down on about nine seconds. Since his first decision, Nate has been hooked on quping-trying different models, playing with more complex puzzles, and solving them faster and faster (he's up to 50 seconds for a 3x3 cube!). Our family now boasts at least 12 different cubes of different sizes and styles. With this skill right in his pocket, I think he can move on to his next hobby: rule the world, of course. © copyright. I'm sure some people will ask why I made this cube, and what's the point of Tony Fisher saying during his voiceover video. But no explanation is required. From the dawn of civilization, man has responded to the call to build impractically large versions of things. The colors are fun, too. In a pair of new videos, Fisher shows off and shows off his giant Rubik's Cube with sides measuring 1.56 meters, or just over 5 feet, stating that his creation may be the largest in the world. Fisher walks around the cube, turning its various axis to show the viewer that it is real and it works. This mammoth toy won't any Rubik's Cube speed contests; watching it turn it's a bit like watching a preview push the clumsy millstones. Not that Fisher minds. How he innes during the video: Guinness Book of Records in the only book I ever liked to read. This content is imported from YouTube. You may be able to find more information about this and similar content on piano.io Armed with their diced and nimble fingers, nearly 100 fierce competitors will descend on the Exploratorium in San Francisco tomorrow to take part in a battle of speed and skill: the 2007 Winter Caltech Rubik Cube competition. We all remember the disappointments caused by the Rubik's Cube as a child, but those who participate in this strange competition, more than just learned to solve the cube - many have mastered it. We have 13 signed participants who can decide the cube in less than 16 seconds on average, says Tyson Mao, founder of the competition, as well as the World Cubs Association, the sport's governing body. We expect one of the highest levels of competition ever. One of the speed demons competing tomorrow is Mao's younger brother, Toby, who holds the current world record for tackling a single cube with a meth of 10.48 seconds. Each participant will compete with their own cube - with preferred voltage and level of lubricant - and will be required to solve the puzzle, mixed by the official of the Caltech competition. The beauty of the sport, which Tyson Mao says is gaining popularity mainly among young men ranging from 12 to 22, is that anyone can learn the cube decision process. Natural talent probably has a bit of an impact, but I think self-determination and motivation is a much more important factor than talent, he says. Luckily for us amateurs, there is still time to learn before the Rubik's World Cup cube in Budapest, Hungary, next November. While Mao says there aren't any special tricks to tackle the cube, see what you can pick up from this video of his finishing Rubik blindfolded in just three minutes. -Emily Masamitsu This content is created and maintained by a third party, and is imported to this page to help users provide their email addresses.
